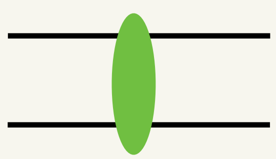
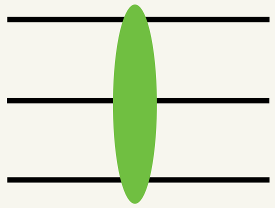
Nuclear structure using chiral effective field theory

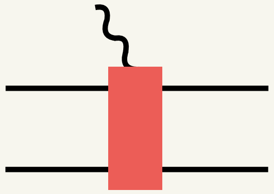
Low-energy **chiral effective field theory** of the standard model



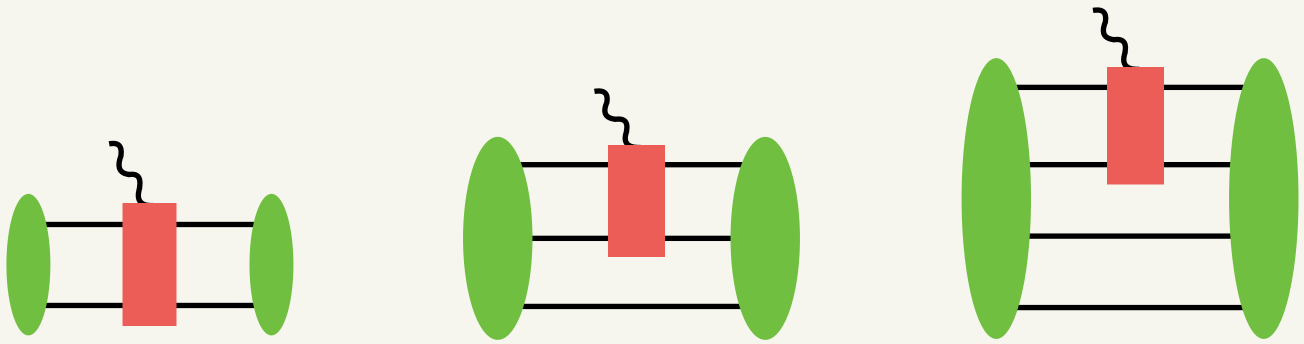
Chiral two-nucleon forces



Chiral three-nucleon forces



Chiral electromagnetic currents



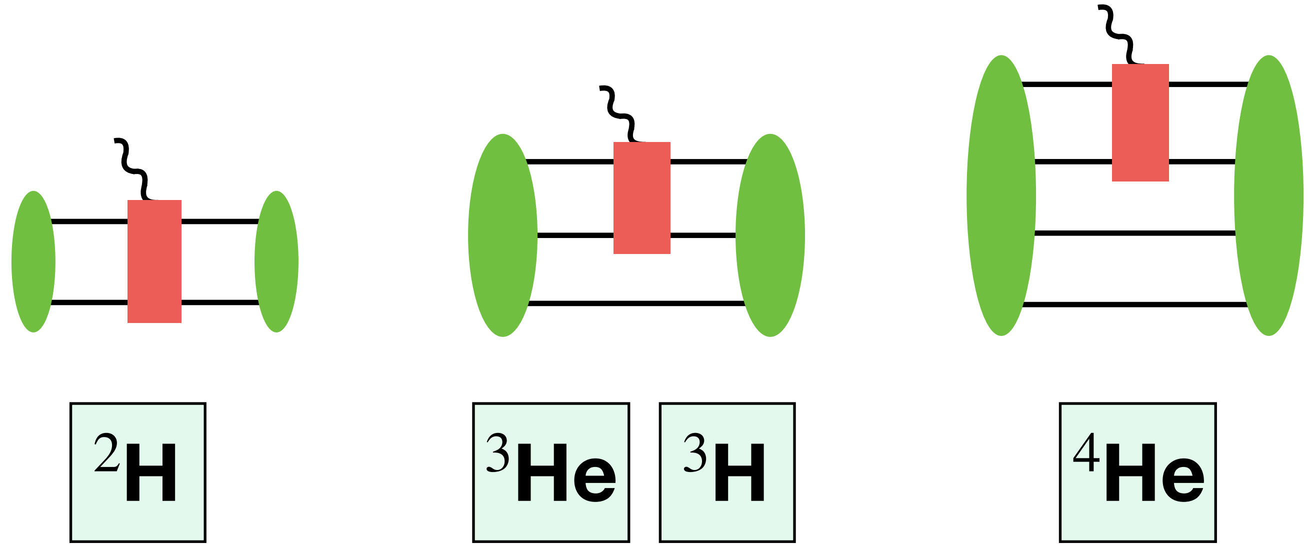
^{2}**H** ^{3}**He** ^{3}**H** ^{4}**He**

charge and magnetic form factors and **radii** of light nuclei

structure of

medium-mass nuclei

Precise calculations of charge radii of super-light nuclei



Motivation:

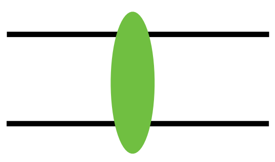
- Precision **tests of nuclear chiral effective field theory (Chiral EFT)**

- Help to resolve long-standing issue with **underpredicted radii of medium-mass and heavy nuclei**

- A new way to **extract the neutron and the proton charge radii** from few-nucleon data

- Search for **Beyond-Standard-Model** physics (lepton universality breaking)

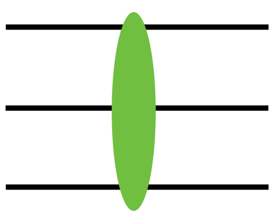
Chiral effective field theory - **precise, accurate** and **consistent**



N^{4}LO$^+$

New **high-precision chiral NN forces** (N^{4}LO$^+$) Reinert et al. PRL 126, 092501 (2021)

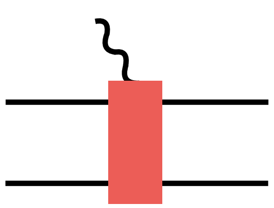
- Nearly perfect description of pp and pn scattering data up to pion production threshold



N^{2}LO

Chiral 3N forces (general N^{2}LO; selected terms at N^{4}LO) Epelbaum:2019kcf

- LECs cD and cE (N^{2}LO) are fitted to RIKEN Nd DCS data and ^{3}He binding energy
- **Consistent** regularisation of N^{3}LO is also in progress



N^{2}LO
Isoscalar: N^{4}LO

2N Chiral electromagnetic currents (general N^{2}LO; isoscalar N^{4}LO)

- N^{2}LO (**isoscalar N^{4}LO**) is derived and regularised consistently with the chiral NN forces
- Consistent regularisation of N^{3}LO (isovector) is in progress

Kolling:2009iq
Kolling:2012cs

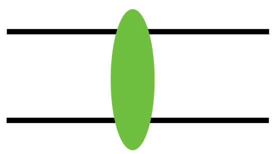
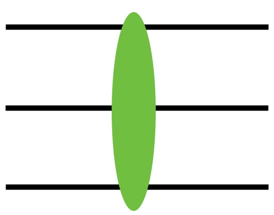
Chiral effective field theory - **precise, accurate** and **consistent**



N^4LO^+

New **high-precision chiral NN forces** (N^4LO^+) Reinert et al. PRL 126, 092501 (2021)

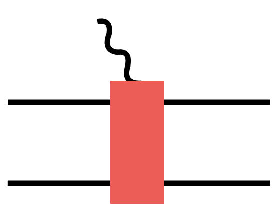
- Nearly perfect description of pp and pn scattering data up to pion production threshold



N^2LO

Chiral 3N forces (general N^2LO; selected terms at N^4LO) Epelbaum:2019kcf

- LECs cD and cE (N^2LO) are fitted to RIKEN Nd DCS data and ^{3}He binding energy
- **Consistent** regularisation of N^3LO is also in progress



N^2LO

Isoscalar: N^4LO

2N Chiral electromagnetic currents (general N^2LO; isoscalar N^4LO)

Kolling:2009iq
Kolling:2012cs
Krebs:2019aka
Krebs:2020pii (Review)

- N^2LO (**isoscalar N^4LO**) is derived and regularised consistently with the chiral NN forces
- Consistent regularisation of N^3LO (isovector) is in progress

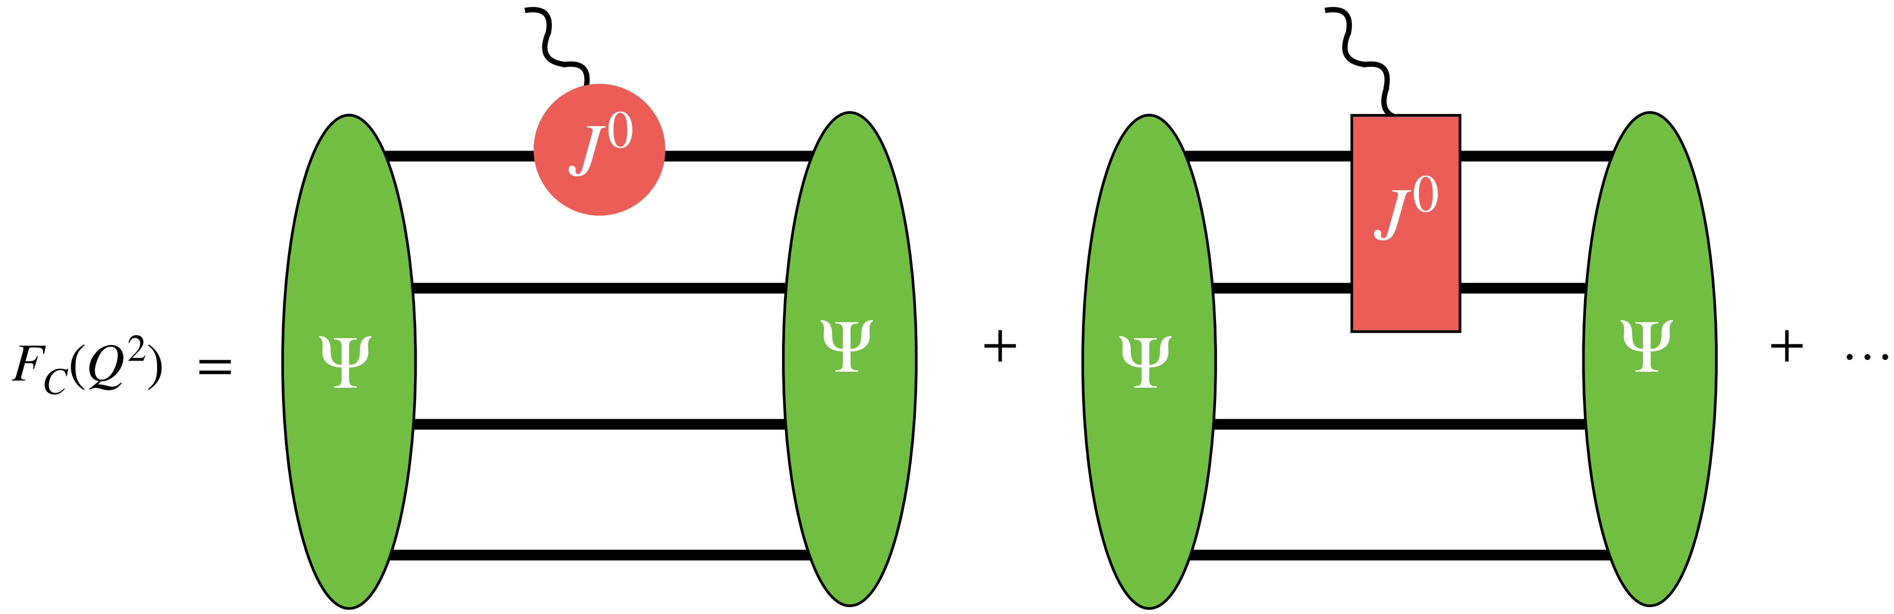
Goals of this study:

- consistent χEFT calculation of isoscalar structure radii of A = 2, 3, 4 nuclei
- aim at N^4LO level of accuracy even in the incomplete calculation
- careful estimation of uncertainties (truncation, statistical, numerical and other)

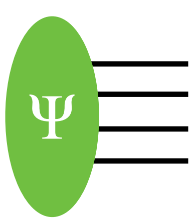
Chiral EFT calculation of the nuclear charge radius

Charge radius r_C is related to the charge form factor $F_C(Q^2)$

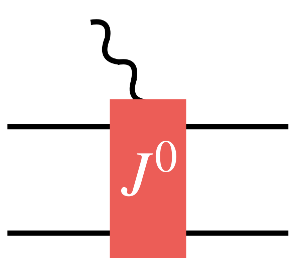
$$r_C^2 = (-6)\frac{\partial}{\partial Q^2} F_C(Q^2)\Big|_{Q=0}$$



The matrix element is a convolution of nuclear wave function and charge density operator



Nuclear wave function based on high-precision chiral EFT interactions



Charge density operator - consistent with chiral nuclear forces

Structure radius

Nuclear **charge radius** can be decomposed into structure, proton and neutron radii

$$r_C^2 = r_{str}^2 + \left(r_p^2 + \frac{3}{4m_p^2} \right) + \frac{N}{Z} r_n^2$$

Nuclear structure radius

- depends on distribution of matter (proton and neutrons) inside the nuclei
- depends on many-body electromagnetic currents
- **can be accurately calculated using chiral nuclear forces and EM currents**

Structure radius = charge radius if protons and neutrons have point-like charge distributions

Deuteron structure radius

& extraction of the neutron charge radius

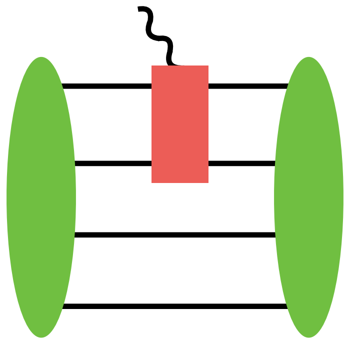
-0.116 ± 0.003	KROHN	66	*n e* scattering (Ne, Ar, Kr, Xe)

[1] KROHN 73 measured -0.112 ± 0.003 fm^2. This value is as corrected by KOESTER 76.
[2] HEACOCK 21 extract the value from Pendelloesung interferometry to measure the neutron structure factors of silicon. This value is strongly anti-correlated with the mean-square thermal atomic displacement.
[3] FILIN 20 extract the value based on their chiral-EFT calculation of the deuteron structure radius and use as input the atomic data for the difference of the deuteron and proton charge radii.

Extracted rn value shows 2σ deviation from the PDG (2022) weighted average $r_n^2 = -0.1155(17) fm^2$

^{4}He charge radius

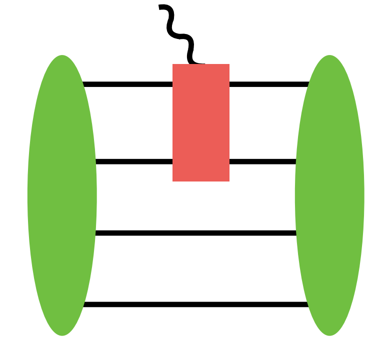
Precision test of the chiral EFT for ^{4}He



^{4}**He**

Preliminary results

Prediction of ^{4}He structure radius

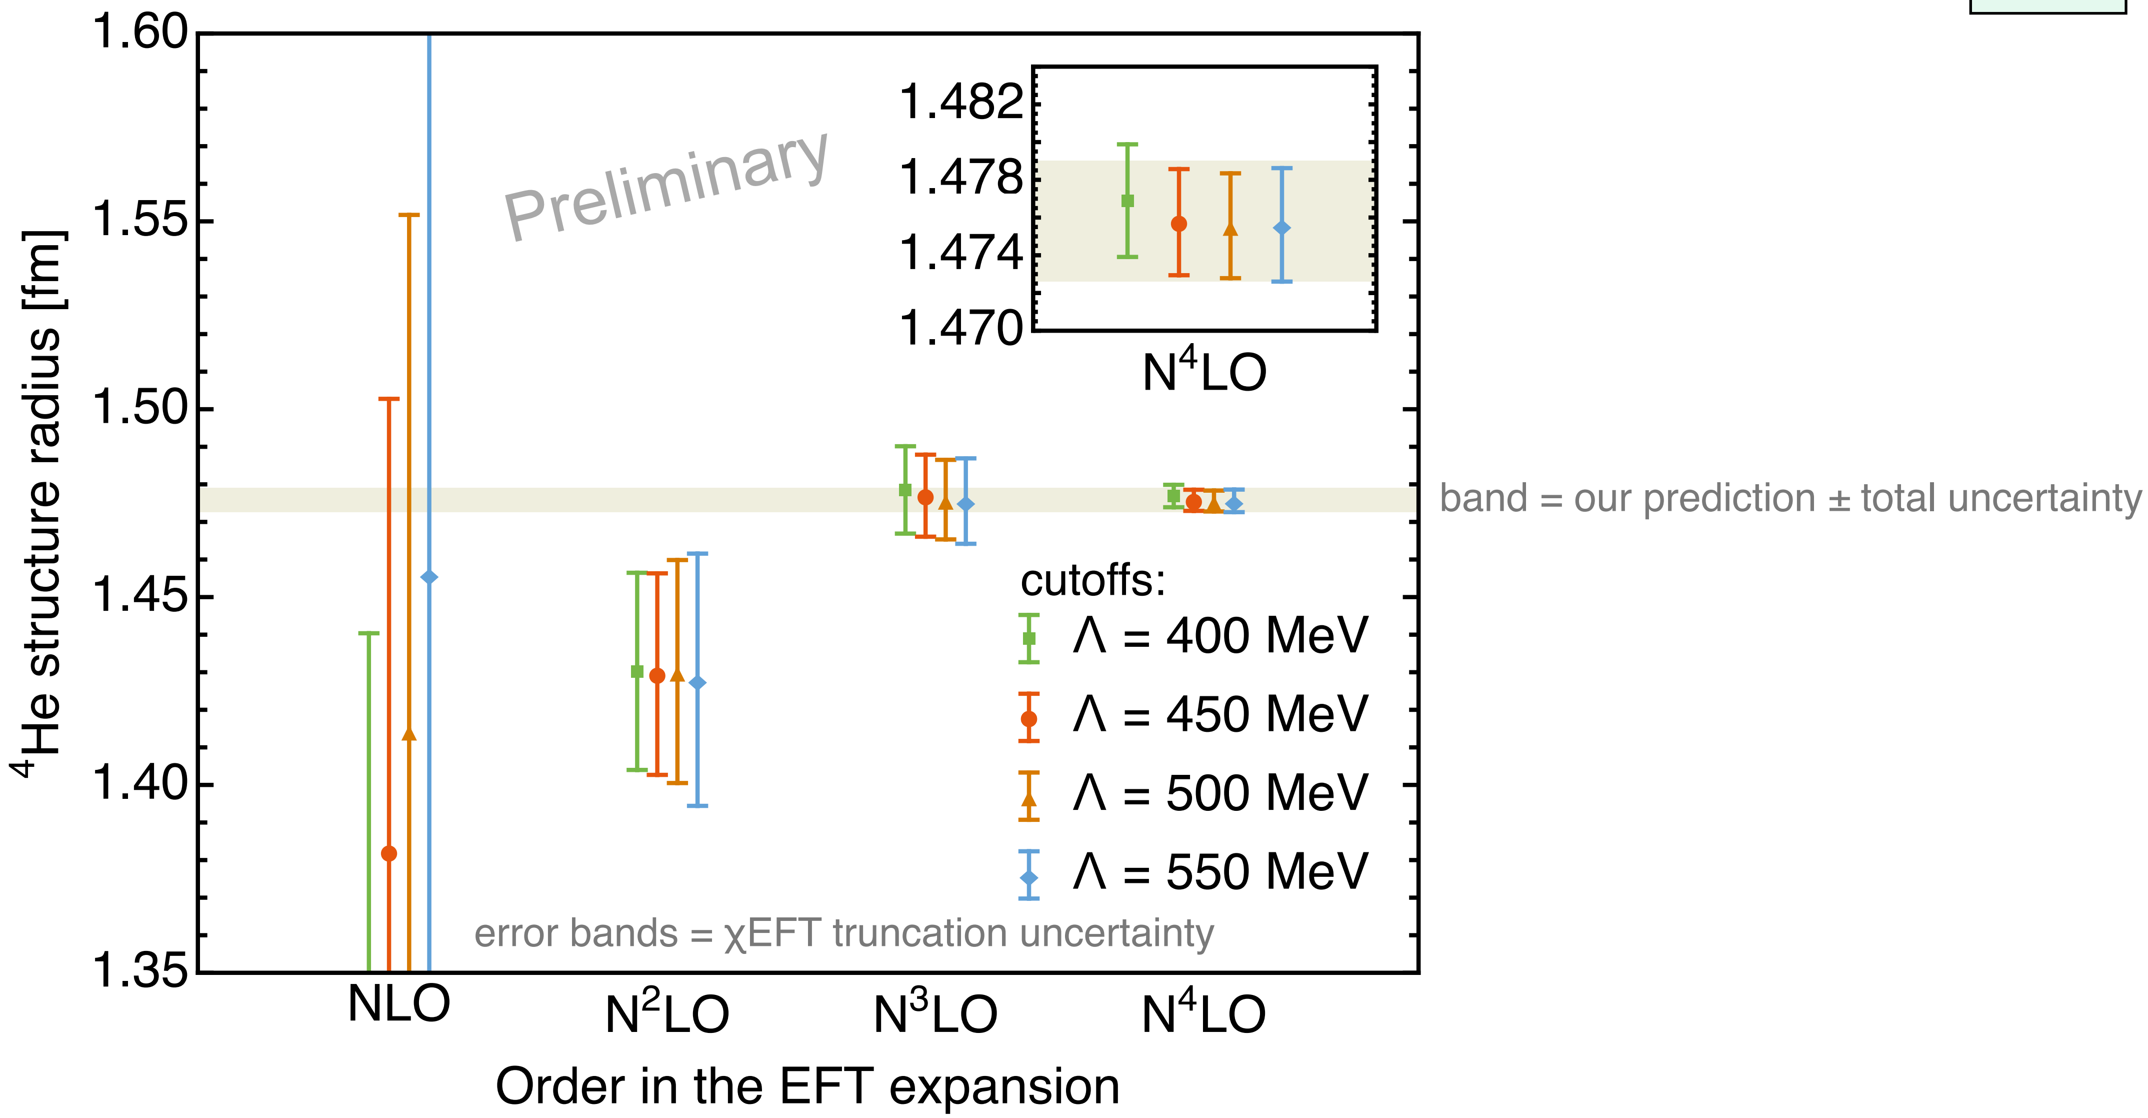


^{4}**He**

Our preliminary prediction for ^{4}He structure radius:

$$r_{str}(^4\mathbf{He}) = 1.4758 \pm 0.0028_{\text{trunc}} \pm 0.0011_{\text{stat}} \pm 0.0010_{\text{nuclFF}}\ fm$$ (Preliminary)

Estimation of truncation error:



Cutoff dependence is smaller than the truncation uncertainty

Chiral EFT expansion converges well

Prediction for ^{4}He charge radius

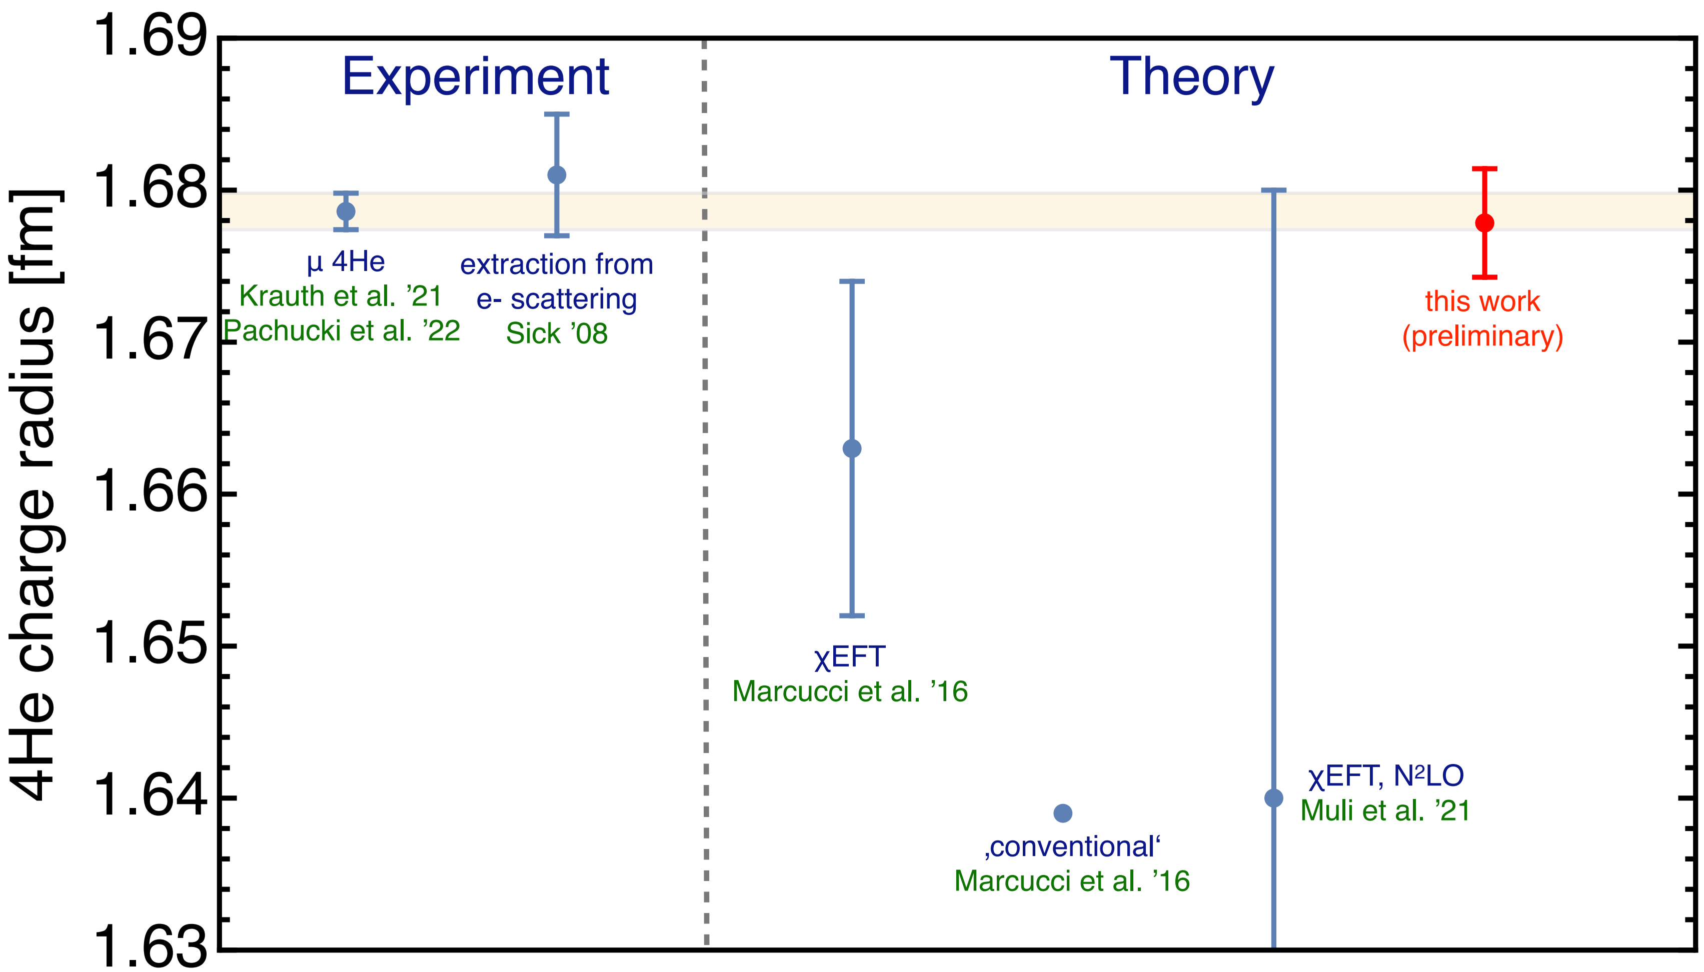
$$r_{str}(^4\mathbf{He}) = 1.4758 \pm 0.0028_{\text{trunc}} \pm 0.0011_{\text{stat}} \pm 0.0010_{\text{nuclFF}}\ fm$$ (Preliminary)

Our prediction for ^{4}He **charge** radius

$$r_C(^4\mathbf{He}) = (1.6775 \pm 0.0035)\, fm$$

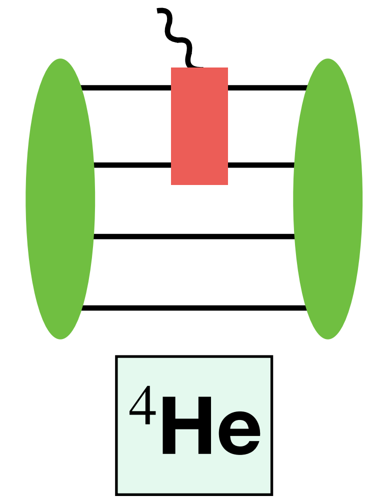
preliminary, using CODATA 2018 r_p and own determination of r_n

$$r_C(^4\mathbf{He}) = r_{str}^2(^4\mathbf{He}) + \left(r_p^2 + \frac{3}{4m_p^2} \right) + r_n^2$$



Our prediction for ^{4}He charge radius is fully consistent with the muonic-atom spectroscopy

Isoscalar nucleon charge radius from data on ^{4}He



Our prediction for ^{4}He **structure** radius

Experimental ^{4}He charge radius
Krauth et al., Nature 589 (2021) 7843, 527-531
+ theory update from Pachucki et al. (2022)

$$r_C(^4\mathbf{He}) = r^2_{str}(^4\mathbf{He}) + \left(r_p^2 + \frac{3}{4m_p^2} \right) + r_n^2$$

Determination

of the isoscalar nucleon charge radius

$$(r_n^2 + r_p^2) = (0.607 \pm 0.010)\, fm^2$$

preliminary

Proton charge radius from isoscalar nucleon radius

Our determination of the

isoscalar nucleon charge radius from ^{4}He

$(r_n^2 + r_p^2) = (0.607 \pm 0.010)\, fm^2$ preliminary

Our determination of the

neutron charge radius from ^{2}H

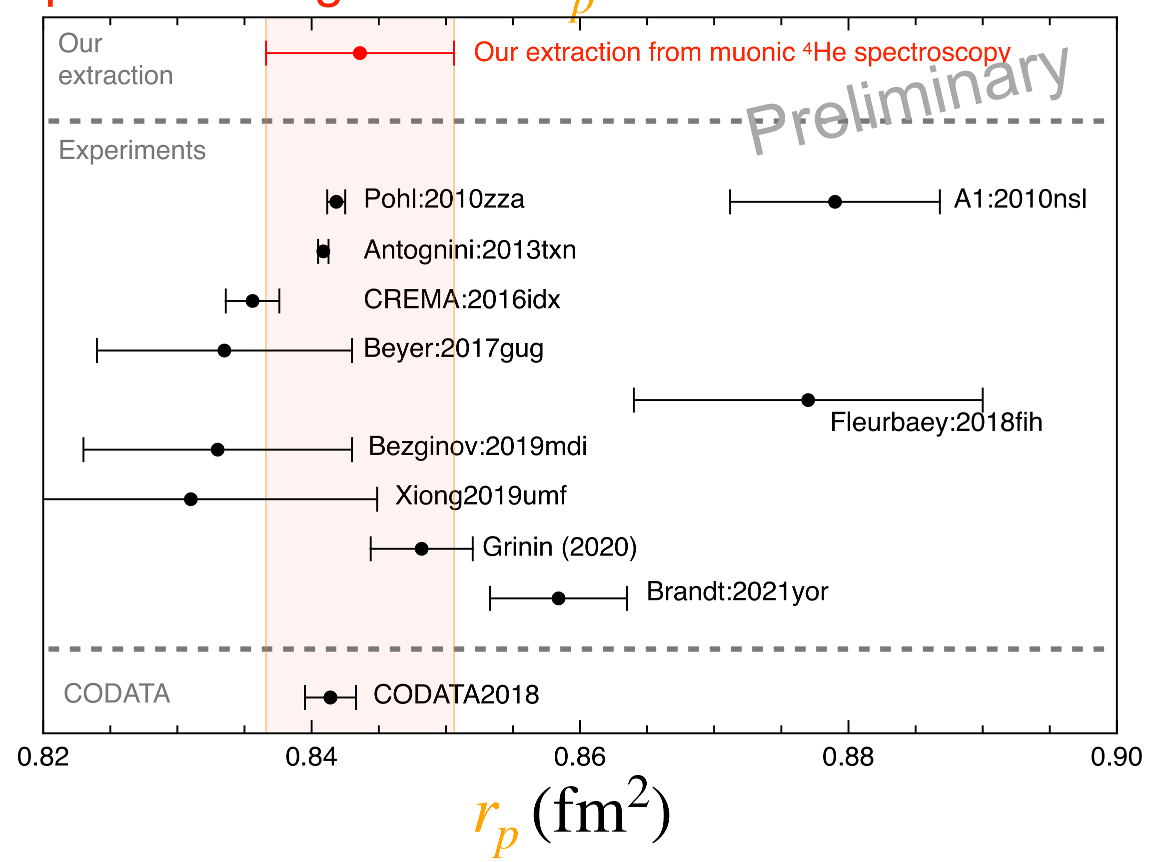
$r_n^2 = -0.105^{+0.005}_{-0.006} fm^2$

AF, Möller, Baru, Epelbaum, Krebs, Reinert,
PRL 124 (2020) 082501; PRC 103 (2021) 024313

New determination of the proton charge radius: $r_p = (0.844 \pm 0.007)\, fm$

preliminary

proton charge radius r_p



Our extraction supports the „small“ proton radius

Prediction for isoscalar 3N charge radius

With all LECs being fixed, we can predict the isoscalar 3N charge radius: $r_C^{isoscalar3N} = \sqrt{\frac{1}{3}(r_C^{3H})^2 + \frac{2}{3}(r_C^{3He})^2}$

$$r_C^{isoscalar3N} = (1.9061 \pm 0.0026)\, fm$$

preliminary, using CODATA 2018 r_p and own determination of r_n

Our result is 10x more precise than current experimental data:

the ^{3}H charge radius from e^- scattering experiments: $r_C^{3H} = (1.7550 \pm 0.0860)\, fm$ (5 %) Amroun et al. '94 (world average)

the ^{3}He charge radius from muonic ^{3}He: $r_C^{3He} = (1.9701 \pm 0.0009)\, fm$ (0.05 %) CREMA 2023 arXiv:2305.11679

Exp. **3N isoscalar charge radius**: (using muonic ^{3}He and old ^{3}H) $r_{C,\,exp.}^{isoscalar3N} = (1.9010 \pm 0.0260)\, fm$ (1.4 %)

T-REX experiment in Mainz [Pohl et al.] aims at measuring r_C^{3H} within ±0.0002 fm (400x more precise)

The isoscalar 3N radius will be then known within ±0.0009 fm

⇒ **precision tests of nuclear chiral EFT!**

Summary

Precise and accurate calculation of A = 2, 3, 4 isoscalar charge radii in chiral effective field theory

Extensive uncertainty analysis

Nuclear structure calculations with sub-percent accuracy!

Charge radii of neutron and proton from light nuclei:

- ^{2}H r_{str} combined with isotope-shift data => extracted the neutron charge radius (2σ tension with PDG)
- ^{4}He r_{str} combined with spectroscopic data => extracted isoscalar nucleon and proton charge radii preliminary

^{4}He calculation: preliminary

- calculated ^{4}He charge radius (0.2% accuracy) agrees with the new μ^{4}He measurement
- no indications of lepton universality breaking at this accuracy level

^{3}H-^{3}He: preliminary

- predicted the isoscalar 3N charge radius r_C (0.1% accuracy)
- our r_C is in agreement with the current exp. value (which has 10x larger errors)
- the ongoing T-REX (^{3}H) exp. in Mainz will allow for a precision test of nuclear chiral EFT

Outlook

In progress:

- **Consistent** inclusion of **isovector 2N currents at N^3LO** and **N^4LO**
- **Consistent** inclusion of **N^3LO** and **N^4LO three-nucleon forces**
- Analysis of **magnetic form factors** (work by Daniel Möller)
- Application to processes with two photons (**polarizabilities**, …)
- Calculation of isoscalar N4LO **charge radii for nuclei with A>4** (work in progress by LENPIC collaboration)

^{4}He: Preliminary

best fit + N^{4}LO truncation uncertainty

3 parameters (LECs) in 2N charge density J^0 are fixed from the form factor data of deuteron and ^{4}He

Prediction for ^{4}He charge radius

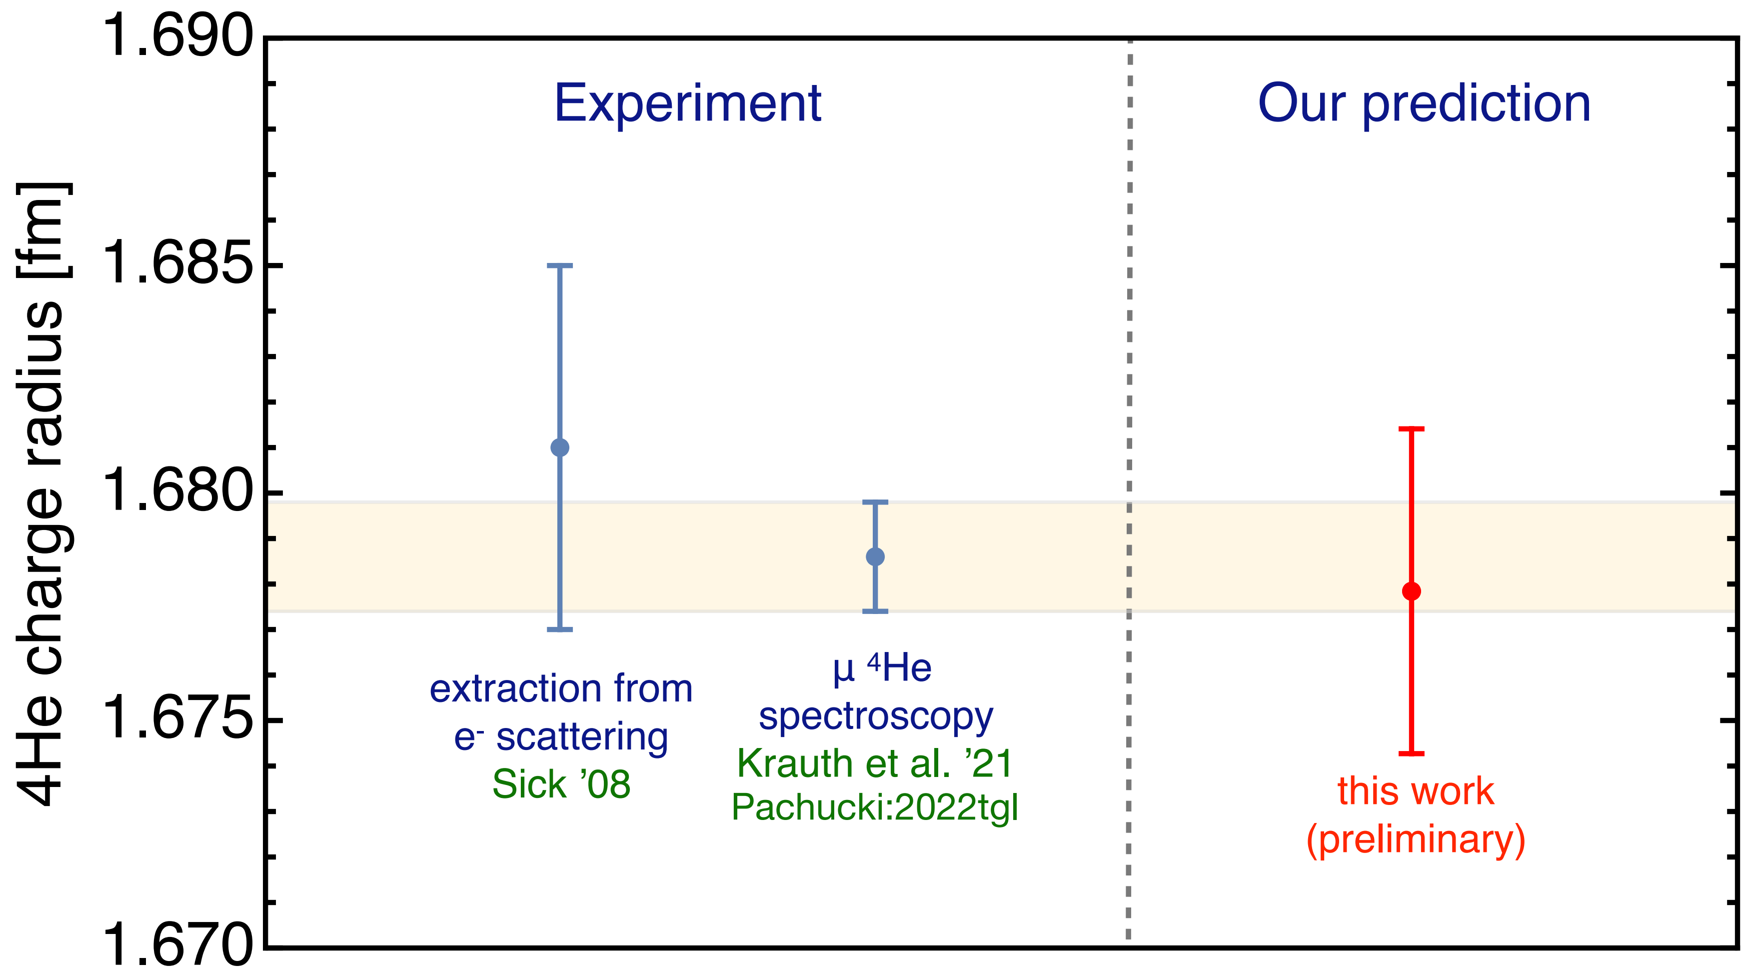
$$r_{str}(^4\mathbf{He}) = 1.4758 \pm 0.0028_{\rm trunc} \pm 0.0011_{\rm stat} \pm 0.0010_{\rm nuclFF}\ fm$$ (Preliminary)

Our prediction for ^{4}He **charge** radius

$$r_C(^4\mathbf{He}) = (1.6775 \pm 0.0035)\, fm$$

preliminary, using CODATA 2018 r_p and own determination of r_n

$$r_C(^4\mathbf{He}) = r_{str}^2(^4\mathbf{He}) + \left(r_p^2 + \frac{3}{4m_p^2}\right) + r_n^2$$



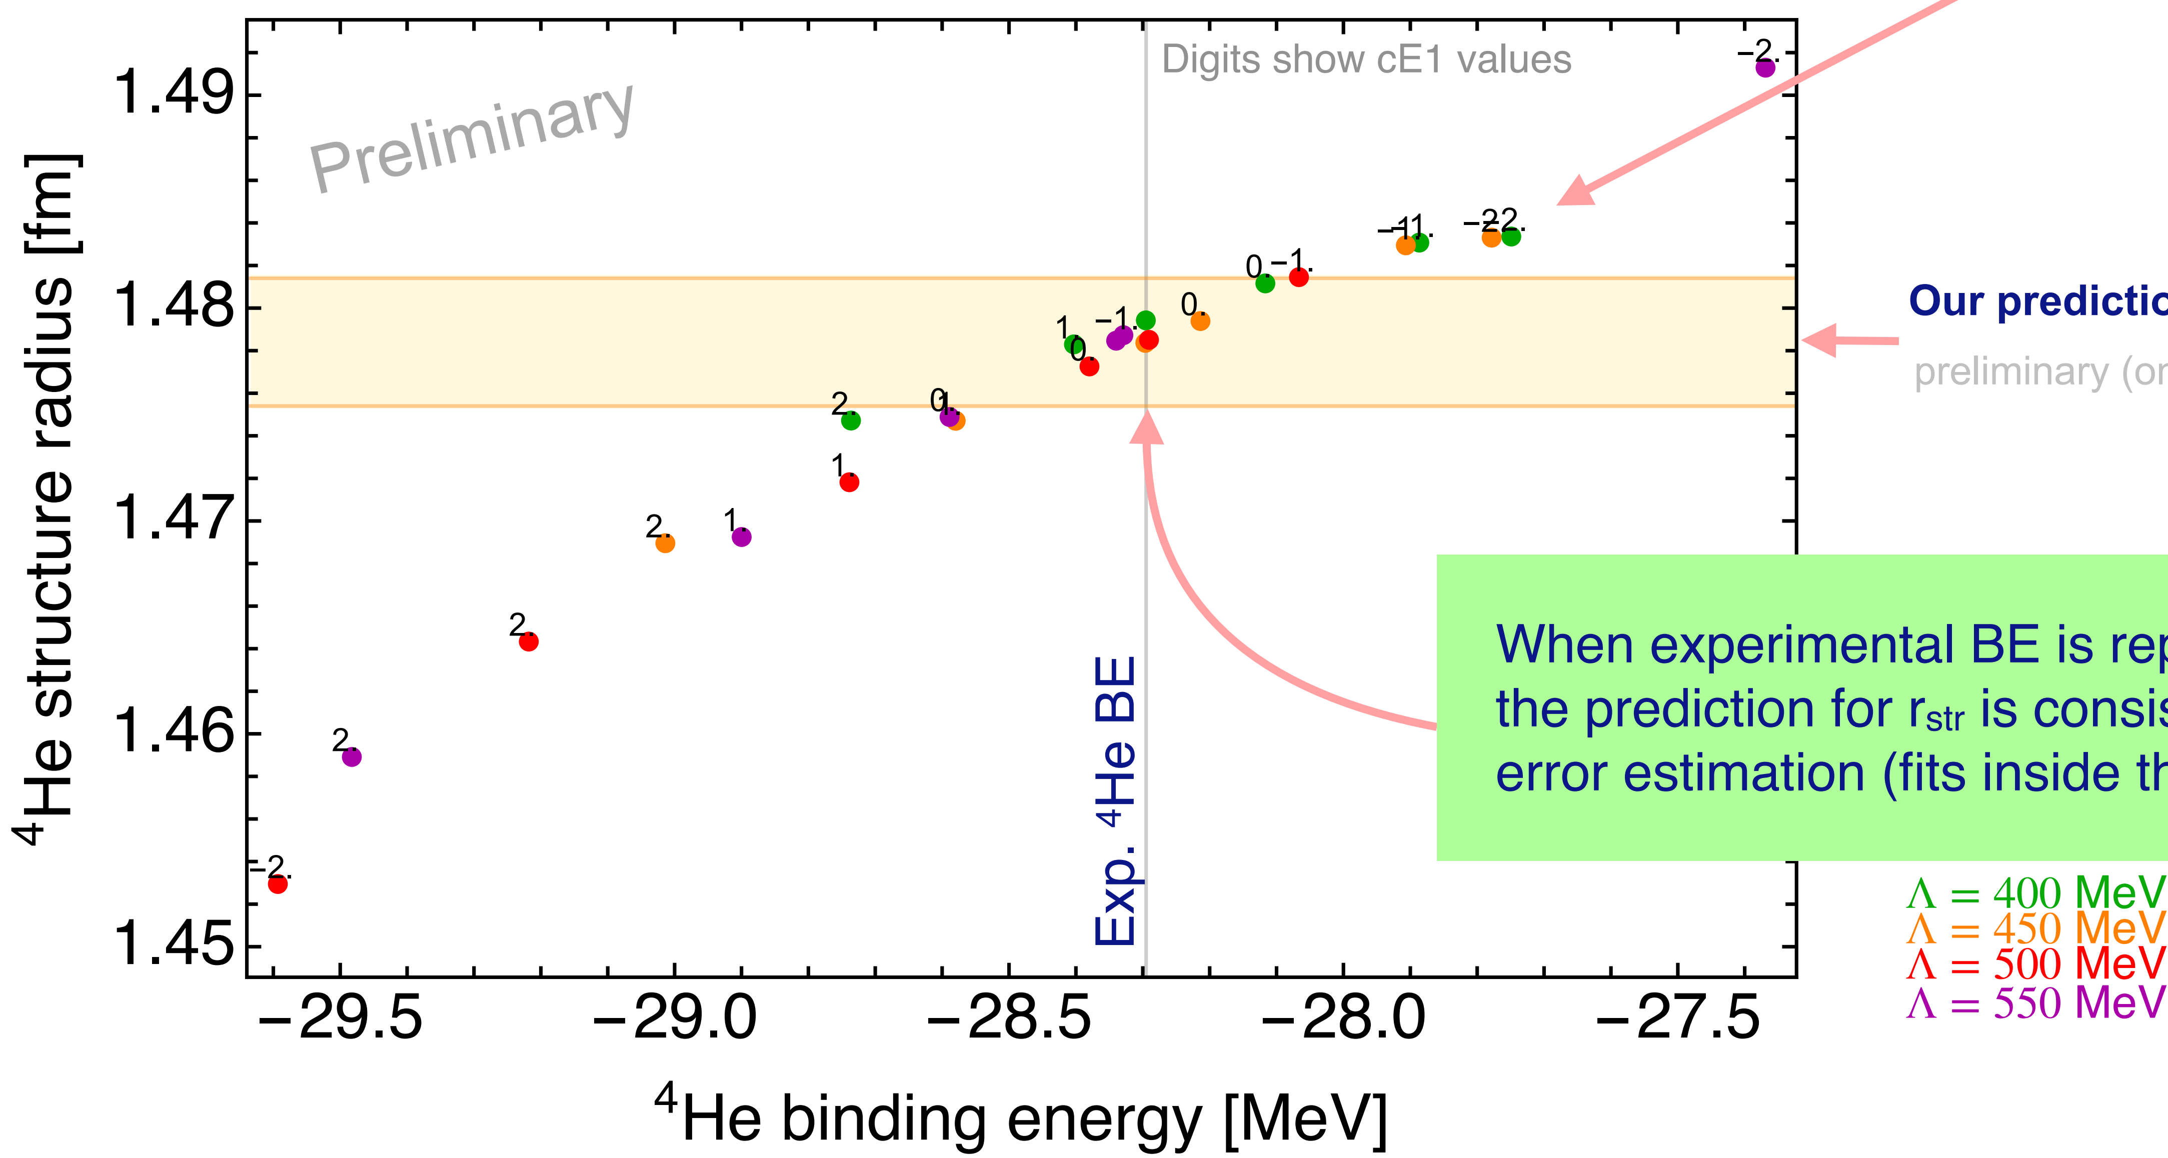
Our prediction for ^{4}He charge radius is fully consistent with the muonic-atom spectroscopy

Correlation between ^{4}He structure radius and binding energy

using variation of **cE1** (N^4LO contact 3NF LEC)

^{4}He **binding energy**
and r_{str} are **strongly correlated**!

^{4}He structure radius vs BE



Our prediction for ^{4}He structure radius:
preliminary (only truncation error is shown)

When experimental BE is reproduced the prediction for r_{str} is consistent with our error estimation (fits inside the orange band)

Many effects (higher-order 3NFs, some relativistic corrections) change BE and radius simultaneously.
Once BE is fitted back to physical value the residual effect is usually ver small.

Estimation of ^{3}H charge radius

Our preliminary prediction for **isoscalar** 3N **charge** radius:

$$r_C^{isoscalar3N} = (1.9061 \pm 0.0026)\,fm$$

preliminary, using CODATA 2018 r_p and own determination of r_n

^{3}He charge radius [CREMA 2023 2305.11679]

$$r_C^{3He} = (1.9701 \pm 0.0009) fm$$

Isoscalar 3N charge radius definition:

$$(r_C^{isoscalar3N})^2 = \frac{(r_C^{3H})^2 + 2\,(r_C^{3He})^2}{3}$$

Expression for ^{3}**H radius:**

$$(r_C^{3H})^2 = 3(r_C^{isoscalar3N})^2 - 2\,(r_C^{3He})^2$$

Coefficients 2 and 3 amplify both theoretical and experimental uncertainties

Our ^{3}H radius estimation:

$$r_C^{(3H)} = (1.7714 \pm 0.0087) fm$$

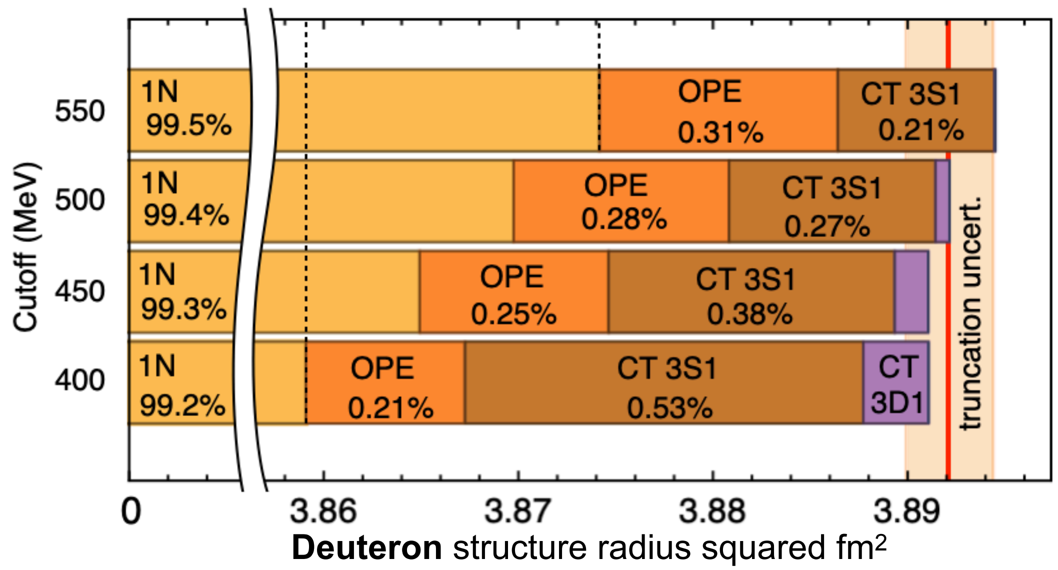
preliminary

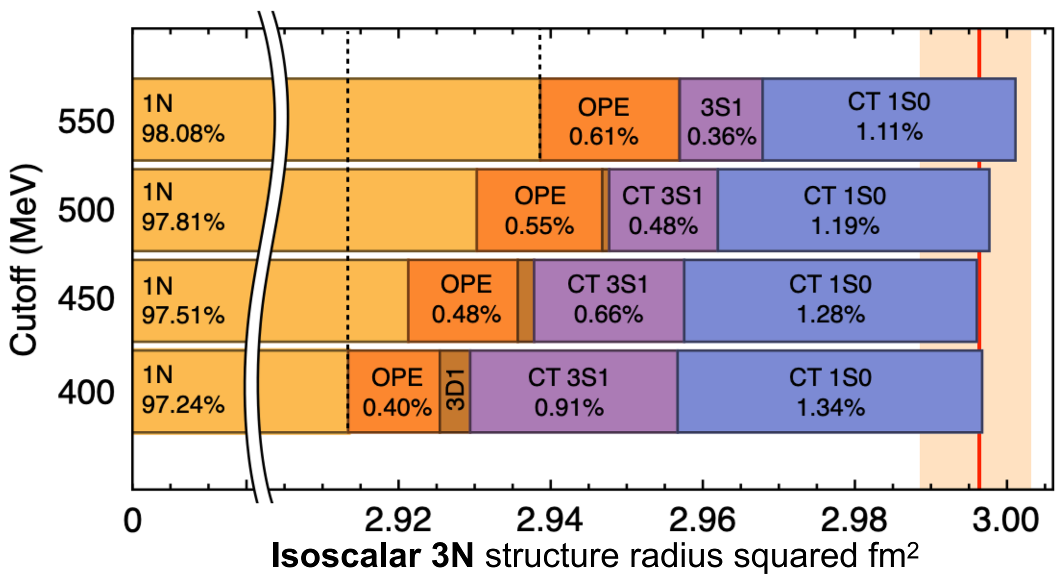
This estimation is 10x more precise than e$^-$ data $r_C^{3H} = (1.7550 \pm 0.0860)\,fm$ Amroun et al. '94 (world average)

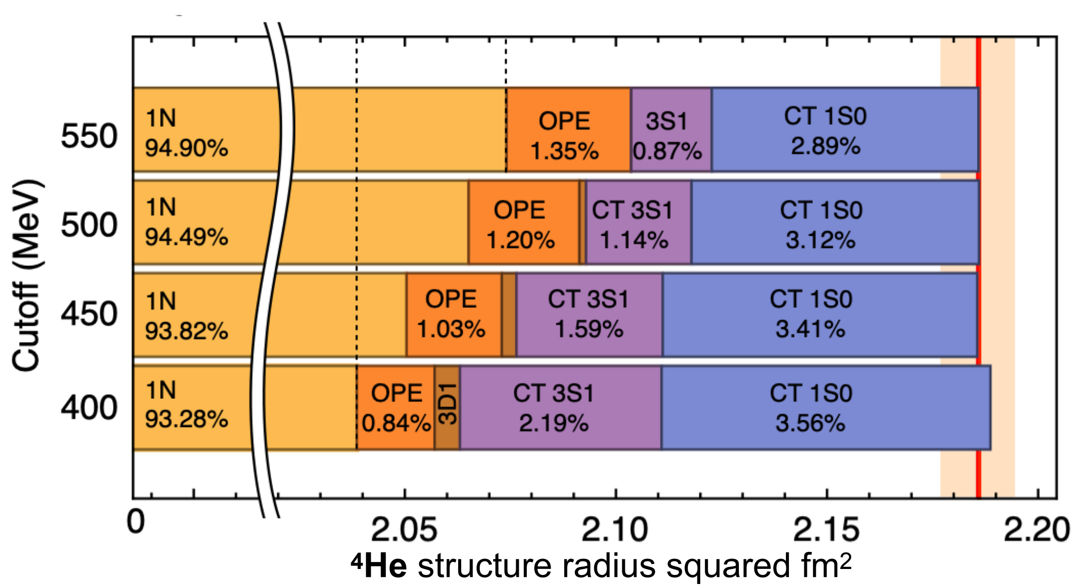
But it suffers from parametric amplification of uncertainties (both from theory and from ^{3}He data)

=> isoscalar 3N charge radius should be used for precision tests

Importance of 2N charge density







Individual contributions to A=2,3,4 structure radii from

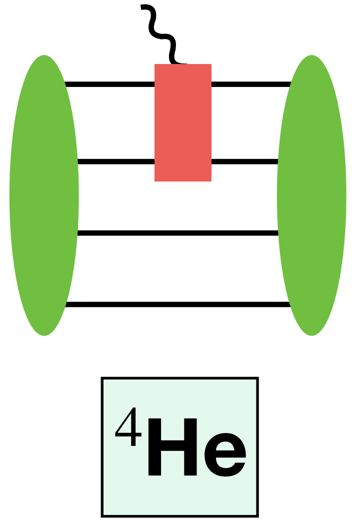
- single-nucleon charge density (1N)
- 2N one-pion exchange density (OPE)
- 2N contact densities (CT 3S1, 3D1, 1S0)

2N charge density contribution to structure radii squared:

deuteron	~ 0.7%
isoscalar 3N	~ 2.5%
^{4}He	~ 6%

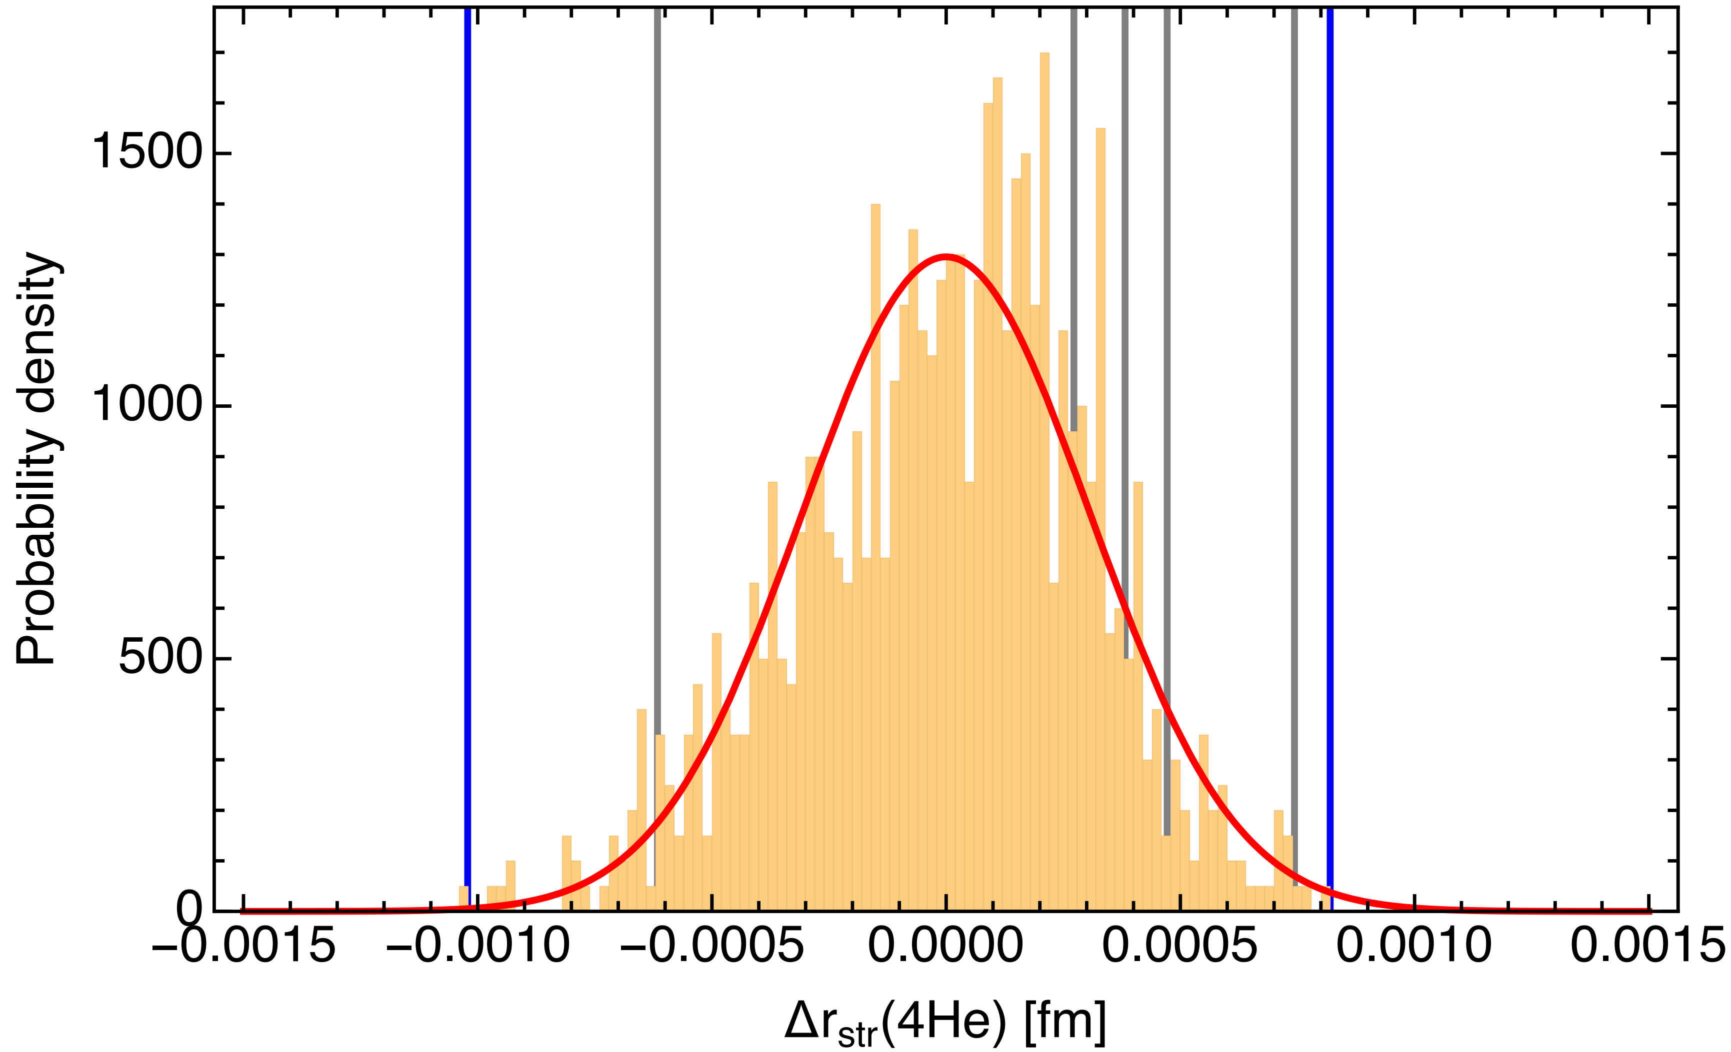
For A=2,3,4 importance of 2N charge grows with A

Sensitivity to nucleon FF parameterisation



Results for 4He structure radius fit with ~1000 variations of nucleon isoscalar FF

GES from dispersive analysis of Bonn group Lin, Hammer and Meißner, PRL 128 2022



Uncertainty from FF parametrisation:

$$r_{str}(^4\mathbf{He}) = 1.4758 \pm 0.0010_{\mathrm{nuclFF}}\ fm$$ (Preliminary)

We have also tested other modern nucleon FF parametrisations and they produce results in the same range
