Nucleon EDMs

- Nucleon electric dipole moments (EDMs): **CP odd**, highly suppressed in the Standard Model with CKM: no EDM at the first order of weak interaction; $|d_n(\text{CKM})| \lesssim 10^{-31} e \text{ cm}$.

X.-G. He, McKellar, Pakvasa, IJMPA 4, 5011 (1989) [E: *ibid*, 6, 1063 (1991)]

- Sensitive to the physics beyond the SM

- Experimental upper limits on hadron EDMs:

□ $|d_n| < 1.8 \times 10^{-26} e \text{ cm}$ C. Abel, et al., PRL 124, 081803 (2020)

□ $|d_p| < 2.1 \times 10^{-25} e \text{ cm}$ B.K. Sahoo, PRD 95, 013002 (2017), based on the measurement in W.C. Griffith, et al., PRL 102, 101601 (2009)

□ $|d_\Lambda| < 1.5 \times 10^{-16} e \text{ cm}$, based on $3 \times 10^6 \Lambda \rightarrow p\pi^-$ events

L. Pondrom, et al., PRD 23, 814 (1981)

From talk by P. Schmidt-Wellenburg (2022)

Theta term and strong CP problem

- Another source of CP violation in SM: the θ term of QCD

$$\mathcal{L}_{\text{QCD},0} = -\frac{1}{4} G_{\mu\nu}^a G^{a,\mu\nu} + \mathcal{L}_{\text{quarks}}$$

- Instanton solutions to the classical EoM

Belavin et al., PLB 59, 85 (1975)

- Non-trivial vacuum structure

Callan, Dashen, Gross, PLB 63, 334 (1976); see e.g. Donoghue et al., Dynamics of the Standard Model

$|n\rangle \rightarrow |n + Q\rangle$, gauge invariant vac. must be superposition of all topological classes

$$|\theta\rangle = \sum_n e^{-in\theta} |n\rangle$$

Topological charge (integer): $Q = \frac{g^2}{32\pi^2} \int d^4x \tilde{G}_{\mu\nu}^a G^{a,\mu\nu}(x)$, $\tilde{G}_{\mu\nu}^a = \frac{1}{2} \epsilon_{\mu\nu\rho\sigma} G^{a,\rho\sigma}$

- QCD Lagrangian with a θ term

$$\mathcal{L}_{\text{QCD}} = \mathcal{L}_{\text{QCD},0} + \frac{\theta g^2}{32\pi^2} \tilde{G}_{\mu\nu}^a G^{a,\mu\nu}$$

- The theta term violates P and CP:

$$G_{\mu\nu} \tilde{G}^{\mu\nu} \propto \mathbf{E} \cdot \mathbf{B} \xrightarrow{\text{CP}} -\mathbf{E} \cdot \mathbf{B}$$

- Strong CP problem: neutron EDM constrains $\bar{\theta} \lesssim 10^{-10}$, with $\bar{\theta} = \theta + \arg(\det M_q)$ the measurable quantity

- A possible solution to the strong CP problem

- Peccei-Quinn mechanism, hidden $U(1)_A$ symmetry

Peccei, Quinn (1977)

- Nambu-Goldstone boson: pseudoscalar axion

Weinberg (1978); Wilczek (1978)

$$\mathcal{L}_a = \frac{1}{2} (\partial_\mu a)^2 + \mathcal{L}(\partial_\mu a, \psi) + \frac{g_s^2}{32\pi^2} \frac{a}{f_a} G_{\mu\nu}^c \tilde{G}^{c,\mu\nu}$$

- Its VEV cancels the theta term $\theta + \frac{\langle a \rangle}{f_a} = 0$, thus solves the strong CP problem

$$\mathcal{L}_{G\tilde{G}} = \left(\theta + \frac{a}{f_a} \right) \frac{g_s^2}{32\pi^2} G_{\mu\nu}^c \tilde{G}^{c,\mu\nu}$$

➤ Expanding around $\langle a \rangle \Rightarrow$ the θ vacuum energy gives the axion potential, $\theta \rightarrow a/f_a$

➤ $\chi_t \Rightarrow m_a, c_4 \Rightarrow$ axion self-interaction

$$m_{a,\text{LO}}^2 = \frac{F_\pi^2 M_{\pi^+}^2 \bar{m}}{2f_a^2 \hat{m}} \quad \text{isospin limit: } m_{a,\text{LO}}^2 f_a^2 = \frac{1}{4} F_\pi^2 M_\pi^2$$

Georgi, Kaplan, Randall (1986)

- Dark matter candidate

Preskill, Wise, Wilczek (1983); Abbott, Sikivie (1983); Dine, Fischler (1983); ...

- Axion decay constant window from astrophysical and cosmological data:

$$10^9 \text{ GeV} \lesssim f_a \lesssim 10^{12} \text{ GeV} \quad \text{e.g., J.E. Kim, G. Carosi, RMP 82, 557 (2010)}$$

For compilations of various constraints, see L. Di Luzio et al., Phys.Rept. 870, 1 (2020)

Cumulants of the QCD topological distribution

- The QCD partition function in a θ vacuum

$$Z(\theta) = \int [DG][Dq][D\bar{q}] e^{-S_{\text{QCD},0}[G,q,\bar{q}] - i\theta Q}$$

- For large Euclidean time τ , dominated by the ground state (vacuum) energy

$$Z(\theta) = e^{-\tau E_{\text{vac}}(\theta)} = e^{-V e_{\text{vac}}(\theta)}$$

V : space-time volume; $e_{\text{vac}}(\theta)$: vacuum energy density

- In terminology of statistics

□ $Z(\theta)$: **moment**-generating function for the distribution of Q , $Z(\theta) = \sum_n m_n \frac{\theta^n}{n!}$

□ $e_{\text{vac}}(\theta)$: **cumulant**-generating function, $e_{\text{vac}}(\theta) = \sum_n c_n \frac{\theta^n}{n!}$

□ Cumulants

$$c_2 = \chi_t = \frac{1}{V} \langle Q^2 \rangle_{\theta=0}, \quad c_4 = -\frac{1}{V} (\langle Q^4 \rangle - 3\langle Q^2 \rangle^2)_{\theta=0}$$

topological susceptibility

For a general relation between cumulants and moments, see FKG, U.-G. Meißner, PLB 749, 278 (2015)

Theta vacuum energy in ChPT

- The θ term can be built into chiral perturbation theory (ChPT) with a complex quark mass matrix: $\chi_\theta = 2B_N \mathcal{M}_q \exp(i\theta/N)$
- Leading order (LO) vacuum energy density in SU(N) ChPT

$$e_{\text{vac}}^{(2)}(\theta) = -\frac{F_N^2}{4} \langle \chi_\theta U_0^\dagger + \chi_\theta^\dagger U_0 \rangle$$

- Vacuum alignment for 2-flavor ChPT: $U_0 = \text{diag}\{e^{i\varphi}, e^{-i\varphi}\}$, minimizing $e_{\text{vac}}^{(2)}(\theta)$ gives

$$\tan \varphi = -\epsilon \tan \frac{\theta}{2}, \quad \epsilon = \frac{m_d - m_u}{m_d + m_u}$$

LO results: R. Brower et al., PLB 560, 64 (2003)

□ Vacuum energy density: $e_{\text{vac}}^{(2)}(\theta) = -F^2 \dot{M}^2(\theta)$

□ Pion mass:

$$\dot{M}^2(\theta) = 2B\hat{m} \cos \frac{\theta}{2} \sqrt{1 + \epsilon^2 \tan^2 \frac{\theta}{2}} \quad \hat{m} = \frac{m_d + m_u}{2}$$

□ Topological susceptibility and the 4th cumulant ($\Rightarrow$ axion mass and self-interaction)

$$\chi_t^{(2)} = \frac{1}{2} F^2 B \hat{m} (1 - \epsilon^2) \quad \Rightarrow \quad m_{a,\text{LO}}^2 f_a^2 = \frac{1}{4} F^2 M_\pi^2$$

$$c_4^{(2)} = -\frac{1}{8} F^2 B \hat{m} (1 + 2\epsilon^2 - 3\epsilon^4)$$

See also H. Leutwyler, A.V. Smilga, PRD 46, 5607 (1992); S. Aoki, H. Fukaya, PRD 81, 034022 (2010); Y.Y. Mao, T.W. Chiu, PRD 80, 034502 (2009)

Theta vacuum energy at NLO

FKG, U.-G. Meißner, PLB 749, 278 (2015)

- χ_t, c_4 were calculated up to the next-to-leading order (NLO) in ChPT

Y.Y. Mao, T.W. Chiu, PRD 80, 034502 (2009); V. Bernard, S. Descotes-Genon, G. Toucas, JHEP 12, 080 (2012)

obtained as an expansion in powers of θ

➤ complicated derivation for each cumulant

1-loop effective action: $Z_{1\text{-loop}} = \frac{i}{2} \ln(\det D)$

with the differential operator $D = D_0(\theta) + \hat{V}(\theta)$

$$= \delta_{PQ} \left(\square + \dot{M}_P^2(\theta) \right)$$

$$= \sigma^\chi + \sigma^\Delta + \underbrace{\left\{ \hat{\Gamma}_\mu, \partial^\mu \right\} + \hat{\Gamma}_\mu \hat{\Gamma}^\mu}_{\text{derivatives/external fields}}$$

$$\sigma_{PQ}^\chi = \frac{1}{8} \left\langle \left\{ \lambda_P, \lambda_Q^\dagger \right\} \left(\chi_\theta^\dagger U + U^\dagger \chi_\theta \right) \right\rangle - \delta_{PQ} \dot{M}_P^2(\theta)$$

contributes to the vacuum energy
expanded as $\dot{M}_P^2(0) + \dots$

$$Z_{1\text{-loop}} = \frac{i}{2} \text{Tr} \ln D_0 + \underbrace{\frac{i}{2} \text{Tr} \left(D_0^{-1} \hat{V} \right)}_{\text{tadpoles}} - \underbrace{\frac{i}{4} \text{Tr} \left(D_0^{-1} \hat{V} D_0^{-1} \hat{V} \right)}_{\text{2-point loops}} + \dots$$

Typo in Eq.(8.5) in the GL (1985) paper: $i/2$ in the second term was written as $i/4$

Theta vacuum energy at NLO

FKG, U.-G. Meißner, PLB 749, 278 (2015)

- A much easier way to get all cumulants (thus the axion potential at NLO) at once:

Notice
$$\frac{1}{8} \left\langle \left\{ \lambda_P, \lambda_Q^\dagger \right\} \left(\chi_\theta^\dagger U_0 + \chi_\theta U_0^\dagger \right) \right\rangle = \delta_{PQ} \dot{M}_P^2(\theta) \Rightarrow \sigma_{PQ}^\chi \Big|_{U \rightarrow U_0} = 0$$

The 1-loop contribution to the vacuum energy density is then given by

$$\begin{aligned} e_{\text{vac}}^{(4, \text{loop})}(\theta) &= -\frac{i}{2V} \ln \det D_0(\theta) = -\frac{i}{2V} \text{Tr} \ln D_0(\theta) \\ &= -\frac{i}{2} (N^2 - 1) \int \frac{d^d p}{(2\pi)^d} \ln \left[-p^2 + \dot{M}^2(\theta) \right] \\ &= \frac{i}{2} (N^2 - 1) \int \frac{d^d p}{(2\pi)^d} \int_0^\infty \frac{d\tau}{\tau} e^{-\tau[-p^2 + \dot{M}^2(\theta)]} \\ &= (N^2 - 1) \dot{M}^4(\theta) \left\{ \frac{\lambda}{2} - \frac{1}{128\pi^2} \left[1 - 2 \ln \frac{\dot{M}^2(\theta)}{\mu^2} \right] \right\} \\ \lambda &\equiv \frac{\mu^{d-4}}{16\pi^2} \left[\frac{1}{d-4} - \frac{1}{2} (\ln(4\pi) + \Gamma'(1) + 1) \right] \quad \text{UV divergence} \end{aligned}$$

holds for SU(2) as well as SU(N) with degenerate quark flavors

- NLO tree-level contribution from the LECs and HECs

$$\begin{aligned}
 e_{\text{vac}}^{(4, \text{tree})}(\theta) &= -\frac{l_3}{16} \left\langle \chi_\theta^\dagger U_0 + \chi_\theta U_0^\dagger \right\rangle^2 + \frac{l_7}{16} \left\langle \chi_\theta^\dagger U_0 - \chi_\theta U_0^\dagger \right\rangle^2 \\
 &\quad - \frac{h_1 + h_3}{4} \left\langle \chi_\theta^\dagger \chi_\theta \right\rangle - \frac{h_1 - h_3}{2} \text{Re}(\det \chi_\theta) \\
 &= -\dot{M}^4(\theta) \left\{ l_3 + l_7 \left[\frac{(1 - \epsilon^2) \tan(\theta/2)}{1 + \epsilon^2 \tan^2(\theta/2)} \right]^2 \right\} \\
 &\quad - 2B^2 \hat{m}^2 \left[(h_1 + h_3) (1 + \epsilon^2) + (h_1 - h_3) (1 - \epsilon^2) \cos \theta \right]
 \end{aligned}$$

- UV divergences from 1-loop and from counterterms cancel, we get the **NLO vacuum energy density in a closed, simple form:**

$$\begin{aligned}
 e_{\text{vac}}(\theta) &= -F^2 \dot{M}^2(\theta) - \dot{M}^4(\theta) \left\{ \frac{3}{128\pi^2} \left[1 - 2 \ln \frac{\dot{M}^2(\theta)}{\mu^2} \right] \right. \\
 &\quad \left. + l_3^r + h_1^r - h_3 + l_7 \left[\frac{(1 - \epsilon^2) \tan(\theta/2)}{1 + \epsilon^2 \tan^2(\theta/2)} \right]^2 \right\}
 \end{aligned}$$

- A similar expression can be derived for SU(N) in the symmetric limit
- Any topological cumulants can now be easily computed up to NLO!

- Following the suggestion in V. Bernard, S. Descotes-Genon, G. Toucas, JHEP 12, 080 (2012):
 - ❑ Extracting SU(N) symmetric quark condensate from LEC-free combination of cumulants
 - ❑ Easy to construct combinations

$$\begin{aligned}\chi_t + \frac{N^2}{4}c_4 &= \frac{3F_N^2 B_N m}{4N} + \frac{3(N^2 - 1) B_N^2 m^2}{32\pi^2 N^2} + \mathcal{O}(p^6) \\ \chi_t - \frac{N^4}{16}c_6 &= \frac{15F_N^2 B_N m}{16N} + \frac{15(N^2 - 1) B_N^2 m^2}{64\pi^2 N^2} + \mathcal{O}(p^6)\end{aligned}$$

- Sum rule between the **topological sector** and **quark condensate** free of NLO correction:

$$\Sigma_N = \frac{N}{m} \left(\frac{8}{5}\chi_t + \frac{2N^2}{3}c_4 + \frac{N^4}{15}c_6 \right) + \mathcal{O}(p^6)$$

Theta vacuum energy at NLO

Z.-Y. Lu, M.-L. Du, FKG, U.-G. Meißner, T. Vonk, JHEP 05, 001 (2020)

- SU(N) ($N \geq 3$) with non-degenerate quark flavors

$$e_{\text{vac}} = -F_0^2 B_0 \sum_f m_f \cos \phi_f - \sum_P \frac{\dot{A}_P^4(\theta)}{128\pi^2} \left[1 - 2 \ln \frac{\dot{A}_P^2(\theta)}{\mu^2} \right] \\ - 16B_0^2 \left[L_6^r \left(\sum_f m_f \cos \phi_f \right)^2 + N (NL_7^r + L_8^r) m_1^2 \cos^2 \phi_1 \right]$$

- No closed expression is possible; relation between the vacuum alignment angle ϕ_f and θ is complicated

$$\phi_f = \sum_{n=0}^{\infty} C_{f,2n+1} \theta^{2n+1}$$

- Recursion relation:

$$C_{f,2n+1} = \sum_{t=1}^n \sum_{(k_1, \dots, k_t)} s_{K_t} \binom{K_t}{k_1, \dots, k_t} \left[\frac{\bar{m}}{m_f} \sum_{i=1}^N \prod_{j=1}^t C_{i,2j-1}^{k_j} - \prod_{j=1}^t C_{f,2j-1}^{k_j} \right]$$

and $C_{f,1} = \bar{m}/m_f$ $\frac{1}{\bar{m}} = \sum_i \frac{1}{m_i}$

- The θ vacuum energy density with $\theta \rightarrow a/f_a$ is the QCD axion potential!

Axion mass and photon coupling at NLO

Z.-Y. Lu, M.-L. Du, FKG, U.-G. Meißner, T. Vonk, JHEP 05, 001 (2020)

- Axion mass and self-coupling at the NLO

- Axion-photon coupling $\mathcal{L}_{a\gamma\gamma} = \frac{1}{4} g_{a\gamma\gamma} a F^{\mu\nu} \tilde{F}_{\mu\nu}$,

$$g_{a\gamma\gamma} = \frac{\alpha_{\text{em}}}{2\pi f_a} \frac{\mathcal{E}}{\mathcal{C}} + g_{a\gamma\gamma}^{\text{QCD}}$$

depending on high-energy model

$$g_{a\gamma\gamma} = \frac{\alpha_{\text{em}}}{2\pi f_a} \left\{ \frac{\mathcal{E}}{\mathcal{C}} - \overbrace{\frac{2}{3} \frac{m_u + 3\bar{m}}{m_u}}^{\text{sizeable } \cancel{I}} \right. \\ \left. - \frac{1024\pi^2}{3\hat{m}} \bar{m} M_{\pi^0}^2 \underbrace{(C_7^W + 3C_8^W)}_{\mathcal{O}(p^6) \text{ anomalous terms}} + \frac{2\bar{m} M_{\pi^0}^2}{3\hat{m}} \left[\overbrace{\frac{f_+(\cos, \sin)}{\sqrt{3}M_\eta^2} + \frac{f_-(\sin, \cos)}{M_{\pi^0}^2}}^{\text{Loop corrections}} \right] \right\}$$

J. Bijnens, L. Girlanda, P. Talavera, EPJC 23, 539 (2002)

Axion mass and photon coupling at NLO

3	5.71(9)	5.77(18)	-2.05(3)	75.6(6)	-0.028(3)

5.691(51)

Early NLO calculation: M. Spalinski, EPJC 41, 87 (1988)

w/ NNLO + QED corrections M. Gorghetto, G. Villadoro, JHEP 03, 033 (2019)

Differences in $g_{a\gamma\gamma}^{\text{QCD}}$: loops +

➤ C_7^W neglected based on the estimate $C_7^W \ll C_8^W$ in Kampf, Moussallam, PRD 79, 076005 (2009);

C_8^W : from $\eta \rightarrow \gamma\gamma$

➤ $C_7^W > C_8^W$ in G. Grilli di Cortona et al.,

JHEP 01, 034 (2016)

➤ $g_{a\gamma\gamma}^{\text{QCD}}$ in U(3) ChPT: -1.63(1) R. Gao, Z.-H. Guo, J. Oller, H.-Q. Zhou, JHEP 04, 022 (2023)

neglected isospin breaking, which is sizable here

Axion-baryon couplings

● Why?

- nuclear bremsstrahlung processes $NN \rightarrow NN a$ in massive stellar objects

e.g., Turner, Phys.Rept. 197, 67 (1990); Raffelt, Phys.Rept. 197, 67 (1990); G. Raffelt, D. Seckel, Phys. Rev. D 52 (1995) 1780; Hanhart, Phillips, Reddy, PLB 499, 9 (2005); ...

- $N\pi \rightarrow N a, \pi\pi \rightarrow \pi a$ also for axion production during nucleosynthesis

S. Chang, K. Choi, PLB 316, 51 (1993)

- novel perspectives in experimental axion (of meV scale) searches?

P. Carenza et al., PRL 126, 071102 (2021)

- Impact of hyperons in neutron stars see, e.g., L. Tolos, L. Fabbietti, PNP 112, 103770 (2020)

Many interesting applications of ChPT to ALP in mesonic processes, too, e.g.,

M. Bauer et al., PRL 127, 081803 (2021); C. Cornella et al., JHEP 06, 029 (2024); D.S. Alves, S. González-Solís, JHEP 07, 264 (2024); ...

QCD with axion

- QCD Lagrangian with axion

$$\mathcal{L}_{\text{QCD}+a} = \mathcal{L}_{\text{QCD},0} - \bar{q}\mathcal{M}_q q + \frac{a}{f_a} \left(\frac{g}{4\pi} \right)^2 \text{Tr} \left[G_{\mu\nu} \tilde{G}^{\mu\nu} \right] + \frac{\partial^\mu a}{2f_a} J_\mu^{\text{PQ}}$$

PQ current: $J_\mu^{\text{PQ}} = f_a \partial_\mu a + \bar{q} \gamma_\mu \gamma_5 \mathcal{X}_q q$

last term: model-dependent

here assuming diagonal axion-quark coupling matrix: $\mathcal{X}_q = \text{diag}\{X_q\}$

$$X_q^{\text{KSVZ}} = 0$$

$$X_{u,d,s}^{\text{DFSZ}} = \frac{1}{3} \sin^2 \beta$$

typical invisible axion models

$$X_{c,b,t}^{\text{DFSZ}} = \frac{1}{3} \cos^2 \beta = \frac{1}{3} - X_{u,d,s}^{\text{DFSZ}}$$

$\tan \beta \in [0.25, 170]$: ratio of VEVs of the two Higgs doublets in the DFSZ model

L. Di Luzio et al., Phys.Rept. 870, 1 (2020)

KSVZ: Kim, PRL 43, 103 (1979); Shifman, Vainshtein, Zakharov, NPB 166, 493 (1980)

DFSZ: Dine, Fischler, Srednicki, PLB 104, 199 (1981); Zhitnitsky, SJNP 31, 260 (1980)

QCD with axion

T. Vonk, FKG, U.-G. Meißner, JHEP 03, 138 (2020); JHEP 08, 024 (2021)

- With an axial rotation, so that

$$\mathcal{L}_{aq} = -(\bar{q}_L \mathcal{M}_a q_R + \text{h.c.}) + \bar{q} \gamma^\mu \gamma_5 \frac{\partial_\mu a}{2f_a} (\mathcal{X}_q - \mathcal{Q}_a) q$$

$$\mathcal{M}_a = \exp\left(i \frac{a}{f_a} \mathcal{Q}_a\right) \mathcal{M}_q, \quad \mathcal{Q}_a \approx \frac{1}{1 + \underbrace{z}_{m_u/m_d} + \underbrace{w}_{m_u/m_s}} \text{diag}(1, z, w, 0, 0, 0)$$

- Rewrite in the form of coupling to external currents $s, p, a_\mu, a_{\mu,i}^{(s)}$:

$$\left(\bar{q} \gamma^\mu \gamma_5 \frac{\partial_\mu a}{2f_a} \left(c^{(1)} + c^{(3)} \lambda_3 + c^{(8)} \lambda_8 \right) q \right)_{q=(u,d,s)^T} + \sum_{q=\{c,b,t\}} \left(\bar{q} \gamma^\mu \gamma_5 \frac{\partial_\mu a}{2f_a} X_q q \right)$$

$$c^{(1)} = \frac{1}{3} (X_u + X_d + X_s - 1)$$

$$c^{(3)} = \frac{1}{2} \left(X_u - X_d - \frac{1-z}{1+z+w} \right)$$

$$c^{(8)} = \frac{1}{2\sqrt{3}} \left(X_u + X_d - 2X_s - \frac{1+z-2w}{1+z+w} \right)$$

$$s + ip = \mathcal{M}_a$$

$$a_\mu = \frac{\partial_\mu a}{2f_a} \left(c^{(3)} \lambda_3 + c^{(8)} \lambda_8 \right)$$

$$a_{\mu,i}^{(s)} = c_i \frac{\partial_\mu a}{2f_a}, \quad i = 1, \dots, 4$$

$$c_1 = c^{(1)}, \quad c_2 = X_c, \quad c_3 = X_b, \quad c_4 = X_t$$

- Building blocks with axion:

$$\begin{aligned} u_\mu &= i \left[u^\dagger \partial_\mu u - u \partial_\mu u^\dagger - i u^\dagger a_\mu u - i u a_\mu u^\dagger \right] \\ u_{\mu,i} &= i \left[-i u^\dagger a_{\mu,i}^{(s)} u - i u a_{\mu,i}^{(s)} u^\dagger \right] = 2a_{\mu,i}^{(s)} \\ \chi_\pm &= 2B_0 \left[u^\dagger (s + ip) u^\dagger \pm u (s + ip)^\dagger u \right] \end{aligned}$$

Axion-baryon couplings

T. Vonk, FKG, U.-G. Meißner, JHEP 03, 138 (2020); JHEP 08, 024 (2021)

- General form of axion-baryon couplings:

$$= G_{aAB} (S \cdot q) \quad \text{with } G_{aAB} = -\frac{1}{f_a} g_{aAB} + \mathcal{O}\left(\frac{1}{f_a^2}\right)$$

- Expansion in the chiral power counting

$$g_{aAB} = \underbrace{g_{aAB}^{(1)}}_{\text{LO}} + \underbrace{g_{aAB}^{(2)}}_{1/m_B} + \underbrace{g_{aAB}^{(3)}}_{\text{NNLO}, 1/m_B^2, \text{1-loop}} + \dots$$

$$\begin{aligned} \mathcal{L}^{(3)} = & d_{36}(\lambda) \langle (v \cdot \partial \bar{B}) \{ (S \cdot u), (v \cdot \partial B) \} \rangle \\ & + d_{37}(\lambda) \langle (v \cdot \partial \bar{B}) [(S \cdot u), (v \cdot \partial B)] \rangle \\ & + d_{38}(\lambda) \langle \bar{B} \{ [(v \cdot \partial), [(v \cdot \partial), (S \cdot u)]], B \} \rangle \\ & + d_{39}(\lambda) \langle \bar{B} [(v \cdot \partial), [(v \cdot \partial), (S \cdot u)]], B \rangle \\ & + d_{36}^i(\lambda) \langle (v \cdot \partial \bar{B}) (S \cdot u_i) (v \cdot \partial B) \rangle \\ & + d_{38}^i(\lambda) \langle \bar{B} [(v \cdot \partial), [(v \cdot \partial), (S \cdot u_i)]] B \rangle \\ & + \dots \end{aligned}$$

Pion axioproducton

- Effects of pions in supernova, $\pi^- p \rightarrow n a$, found to be important
 - ▣ surpasses bremsstrahlung $NN \rightarrow NN a$, increases axion emission
 - ▣ leads to harder axions

➤ possible detection with megaton water Cherenkov detectors via $a N \rightarrow \pi N$

- ▣ $a N \rightarrow \pi N$ was estimated as

$$\sigma(a N \rightarrow \pi N) \approx \frac{F_{\pi}^2}{f_a^2} \underbrace{\sigma(\pi N \rightarrow \pi N)}_{\substack{\text{assumed to be} \\ \sim 100 \text{ mb}}} \sim 1 \text{ mb} \left(\frac{\text{GeV}}{f_a} \right)^2$$

and Δ was argued to be important;

10^3 pions estimated for a SN at 1 kiloparsec

- However, $a N \rightarrow \Delta \rightarrow \pi N$ breaks isospin!

➤ Is the suppression factor $\sim 10^{-2}$ as given by $\mathcal{O}\left(\frac{m_d - m_u}{m_s, \Lambda_{\text{QCD}}}\right)$ or $\mathcal{O}(\alpha)$?

P. Carenza et al., PRL 126, 071102 (2021)

Pion axioproducton

T. Vonk, FKG, U.-G. Meißner, PRD 105, 054029 (2022)

- Mild isospin breaking in $aN \rightarrow \Delta \rightarrow \pi N$: $\propto \frac{m_d - m_u}{m_d + m_u} \approx 0.34$

$$c^{(3)} = \frac{1}{2} \left(X_u - X_d - \frac{1 - z}{1 + z + w} \right)$$

- Real calculations reveal **at least one order of magnitude suppression** (depending on the axion models) $\Rightarrow$ at most $\mathcal{O}(100)$ pions

Supernova axion emission with Δ contribution estimated in S.-Y. Ho et al., PRD 107, 075002 (2023)

Pion axioproducton

C.-C. Li, T.-R. Hu, FKG, U.-G. Meißner, PRD 109, 075050 (2024)

- Including both the $\Delta(1232)$ and the Roper resonance $N^*(1440)$ that strongly couples to πN , depending on $\sin^2\beta$, about 20 to 1000 smaller than the naïve estimate of

$$\sim 1 \text{ mb} \left(\frac{\text{GeV}}{f_a} \right)^2$$

➤ $an \rightarrow \pi^- p$ cross sections

✓ S waves

✓ Total: S+P waves

solid: w/ resonances
dashed: w/o resonances

- Derived a closed form of the θ -vacuum energy density (QCD axion potential) at NLO
 - ✓ NLO-free relation between quark condensate and top. cumulants
- Precision calculation of the axion properties
 - ✓ mass, self-couplings, $a\gamma\gamma$ coupling
 - ✓ axion-baryon couplings
 - $g_{a\Lambda\Lambda}$ could be much larger than g_{ann} , impact on the axion emissivity of dense stellar objects such as neutron stars?
 - ✓ Pion axioproduction cross section much smaller than naïve estimate
- ❑ Consequences remain to be explored

Thank you for your attention!
