# Light Pseudoscalar Mesons Decays at JLab

Liping Gan
University of North Carolina Wilmington

## Outline

- Introduction of Physics
- PrimEx Primakoff Program
- JLab Eta Factory (JEF) at GlueX
- Summary

Thanks for support by NSF PHY-1812396 and PHY-2111181.

# Open Questions in Modern Physics

- What is the origin of QCD confinement?
- How did the visible mass emerge in the early universe?
- What is the cause of the matter-antimatter asymmetry in the universe?
- What is the nature of dark matter?

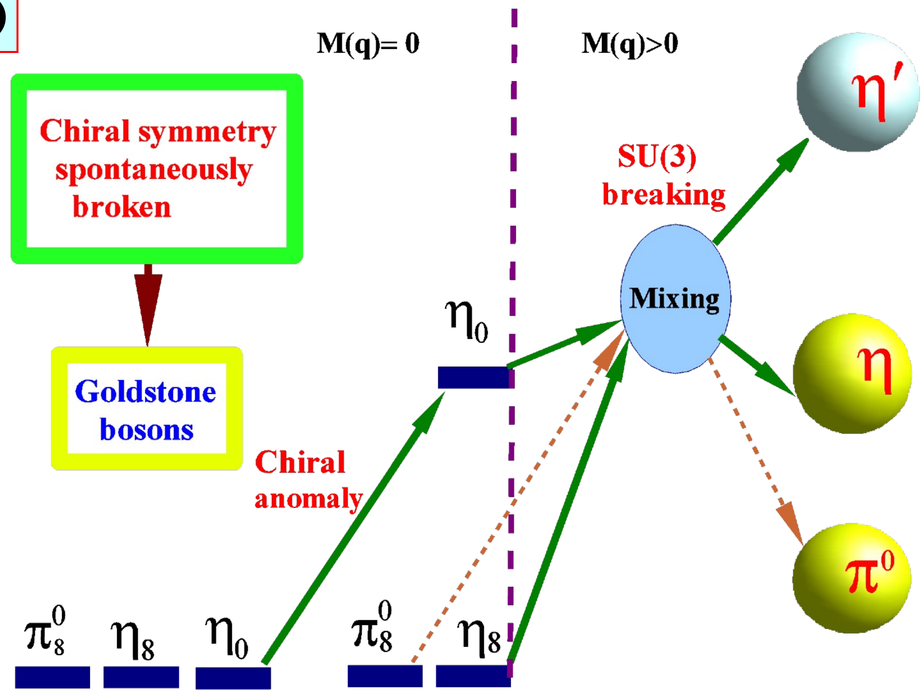
Light pseudoscalar mesons offer a sensitive tool to explore these fundamental questions.

# Low-Energy QCD Symmetries and Light Mesons

- **QCD Lagrangian in Chiral limit ($m_q \to 0$) is invariant under:**

$$SU_L(3) \times SU_R(3) \times U_A(1) \times U_B(1)$$

- **Chiral symmetry $SU_L(3)xSU_R(3)$ spontaneously breaks to SU(3)**
  - 8 Goldstone Bosons (GB)
- **$U_A(1)$ is explicitly broken: (Chiral anomalies)**
  - Non-zero mass of $\eta_0$
  - $\Gamma(\pi^0 \to \gamma\gamma)$, $\Gamma(\eta \to \gamma\gamma)$, $\Gamma(\eta' \to \gamma\gamma)$
- **$SU_L(3)xSU_R(3)$ and SU(3) are explicitly broken:**
  - GB are massive
  - Mixing of $\pi^0$, $\eta$, $\eta'$



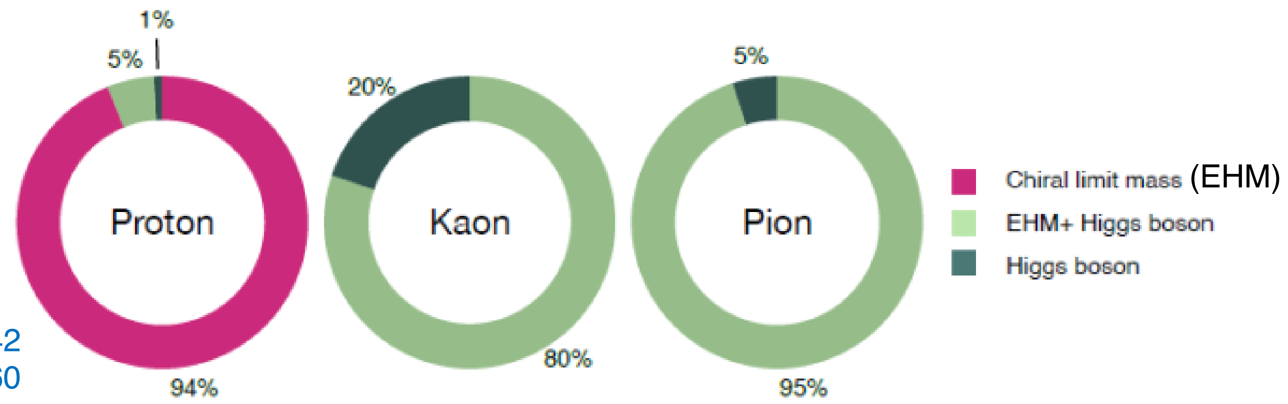
**The $\pi^0$, $\eta$, $\eta'$ system provides a rich laboratory to study the symmetry structure of low-energy QCD.**

# What is the origin of visible mass?

## Mass-generating mechanisms:

- Higgs boson, alone is responsible for <2% of the visible mass in the universe.

- Emergent Hadron Mass (EHM) and its constructive interference with Higgs-boson account for >98% of the visible mass.



Few Body Syst. 63 (2022) 2,42
Few Body Syst. 65 (2024) 2,60

Complementary to proton, pseudoscalar mesons offer a unique opportunity to study the interference between two known mass generating mechanisms.

# Discrete Symmetries

| Class | Violated | Conserved | Interaction |
|---|---|---|---|
| 0 | | $C, P, T, CP, CT, PT, CPT$ | strong, electromagnetic |
| I | $C, P, CT, PT$ | $T, CP, CPT$ | (weak, with no KM phase or flavor-mixing) |
| II | $P, T, CP, CT$ | $C, PT, CPT$ | |
| III | $C, T, PT, CP$ | $P, CT, CPT$ | |
| IV | $C, P, T, CP, CT, PT$ | $CPT$ | weak |

## Class II: P-, CP-violation

- QCD θ-term
- Examples: $\eta^{(\prime)} \rightarrow 2\pi$, $\eta^{(\prime)} \rightarrow \pi^{+}\pi^{-}\gamma^{(*)}$
- Strong constraints from EDM measurements

## Class III: C-, CP-violation

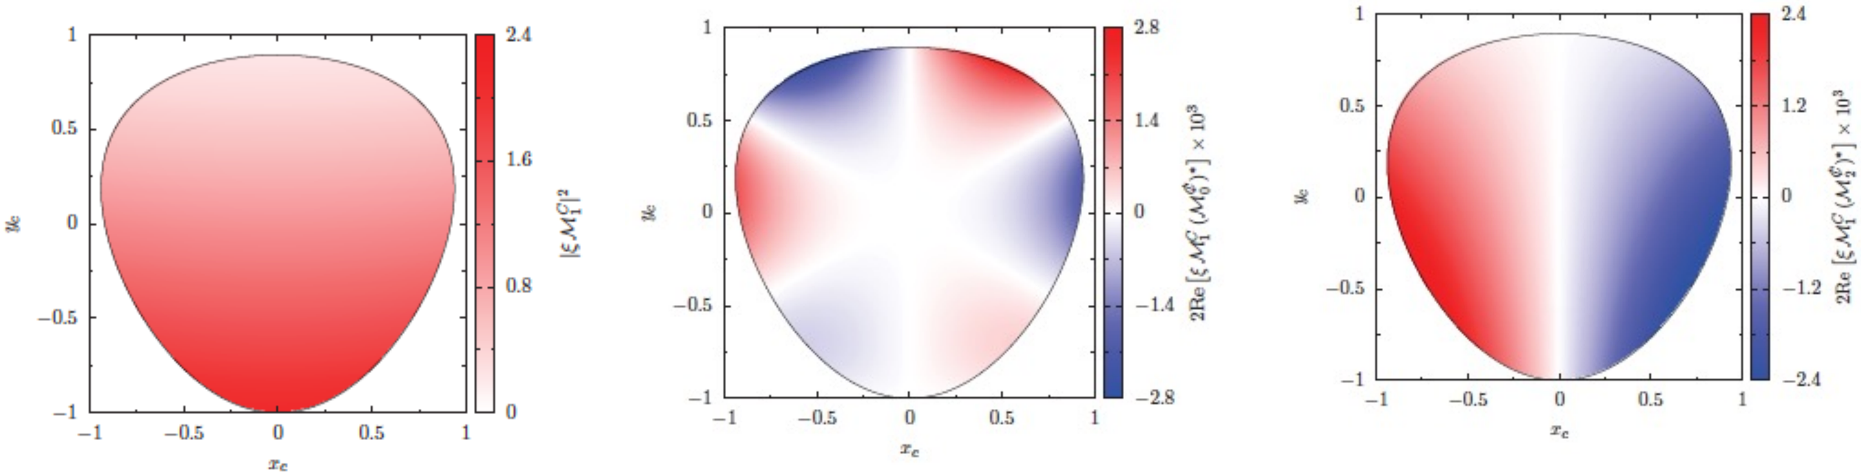
- A C- and T-violating, and P-conserving interaction was proposed by Bernstein, Feinberg and Lee, but little theoretic progress for a long time. Phys. Rev.,139, B1650 (1965)
- Recent new theoretic development (presented by B. Kubis this morning).
- Electroweak radiative corrections mix class II and III, but much weaker EDM constraints.
- Examples: $\eta^{(\prime)} \rightarrow 3\gamma$, $\eta^{(\prime)} \rightarrow \pi^{o}\gamma^{(*)}$ …

Class III has much weaker experimental constraint, offer an opportunity for experimental search of new physics in η decays.

# Class III: C- and CP-Violation in $\eta^{(\prime)} \to \pi^+\pi^-\pi^0$, $\eta' \to \pi^+\pi^-\eta$

- Dalitz plot decomposition (central fit result)

$$|\mathcal{M}_c|^2 \approx |\mathcal{M}_1^{C}|^2 + 2\mathrm{Re}\left[\mathcal{M}_1^{C}\,(\mathcal{M}_0^{\not C})^*\right] + 2\mathrm{Re}\left[\mathcal{M}_1^{C}\,(\mathcal{M}_2^{\not C})^*\right]$$

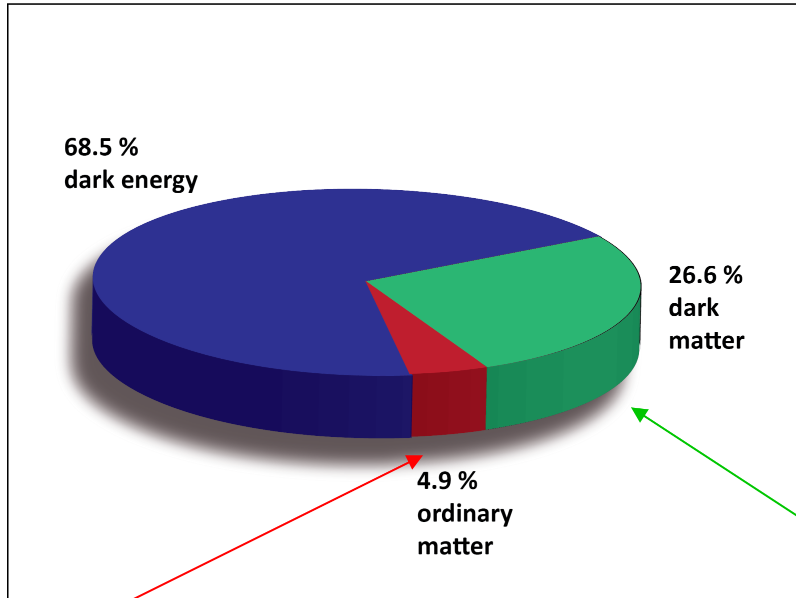


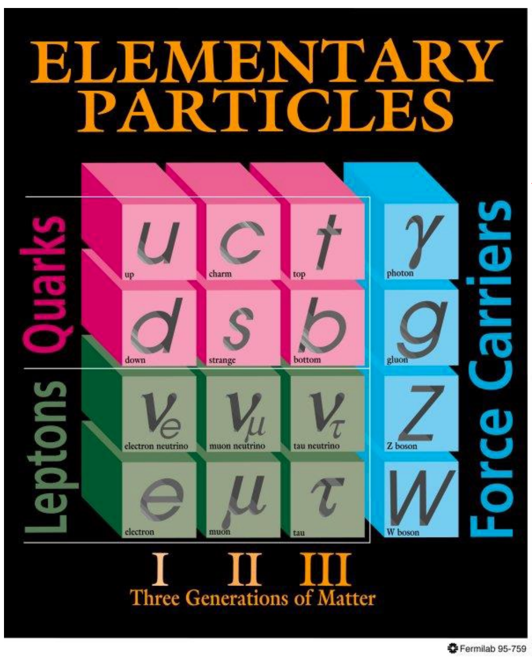
- $\mathcal{M}_0^{\not C}$ and $\mathcal{M}_2^{\not C}$ lead to different interference patterns

- CP-violation from these processes is not bounded by EDM.

- Complementary to nEDM searches even in the case of T and P odd observables, since the flavor structure of the $\eta$ is different from the nucleon.

# BSM Physics in Dark Sector

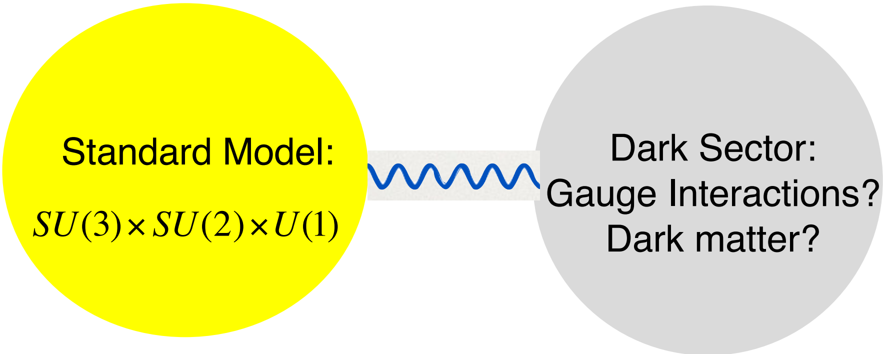




## Dark Sector

- New gauge forces, bosons and fermions beyond SM.
- The stability of dark matter can be explained by the dark charge conservation.

# Portals Coupling SM and Dark Sector



*vector:*

- Leptophobic vector *B'*

  $\eta, \eta' \to B'\gamma \to \pi^0\gamma\gamma$, $(0.14 < m_{B'} < 0.62\ \mathrm{GeV})$;

  $\eta' \to B'\gamma \to \pi^+\pi^-\pi^0\gamma$, $(0.62 < m_{B'} < 1\ \mathrm{GeV})$.

- X boson or dark photon: $\eta, \eta' \to X\gamma \to e^+e^-\gamma$

*scalar S:* $\eta \to \pi^0 S \to \pi^0\gamma\gamma,\ \pi^0 e^+e^-$, $(10\ \mathrm{MeV} < m_S < 2m_\pi)$;
$\eta, \eta' \to \pi^0 S \to 3\pi,\ \eta' \to \eta S \to \eta\pi\pi$, $(m_S > 2m_\pi)$.

## Portals:

vector $\kappa B^{\mu\nu} V_{\mu\nu}$

Scalar $H^+ H(\varepsilon S + \lambda S^2)$

Fermion $\xi LHN$

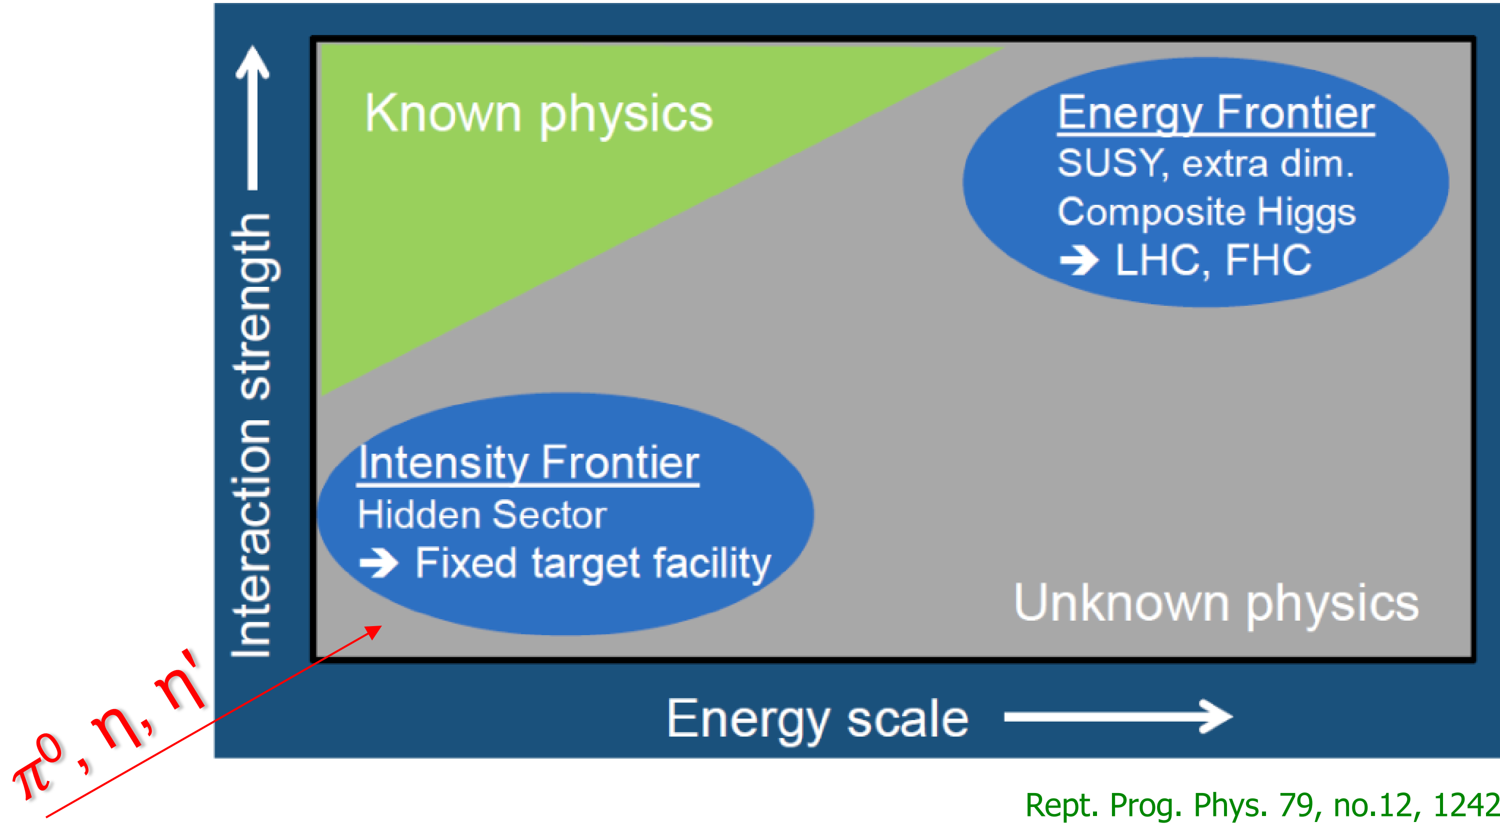
ALP $c_{\gamma\gamma}\frac{\alpha}{4\pi}\frac{a}{f}F_{\mu\nu}\widetilde{F}^{\mu\nu} + c_{GG}\frac{\alpha_s}{4\pi}\frac{a}{f}G^a_{\mu\nu}\widetilde{G}^{a,\mu\nu}$

*Fermion:* $\eta \to \pi^0 H$,
with $H \to \nu N_2$, $N_2 \to h' N_1$, $h' \to e^+e^-$

*Axion-Like Particles (ALP):* $\eta, \eta' \to \pi\pi a \to \pi\pi\gamma\gamma,\ \pi\pi e^+e^-$

Phys. Rept. 945 (2022) 1-105, arXiv:2207.06905, arXiv:2203.07651

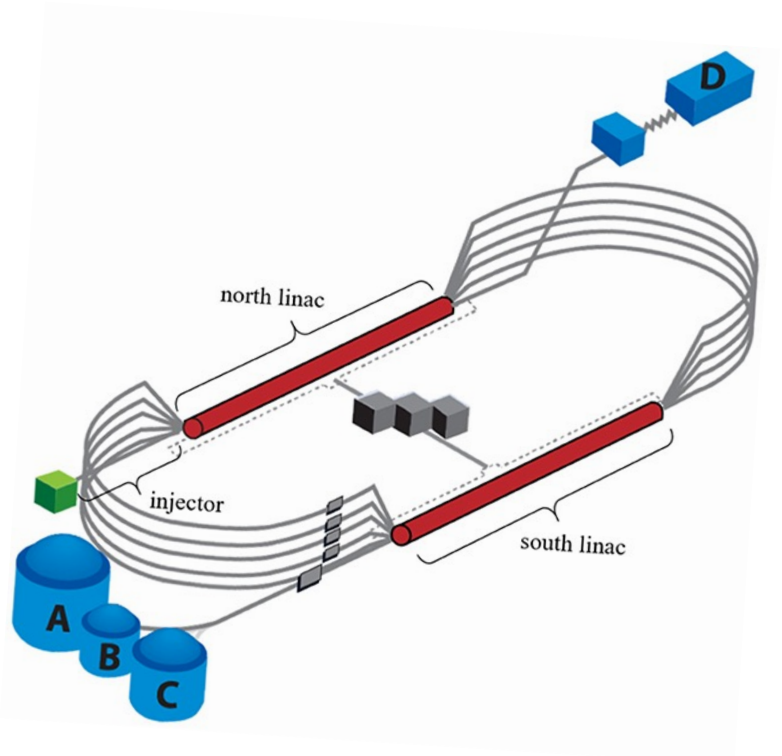
# Landscape of BSM Physics Search



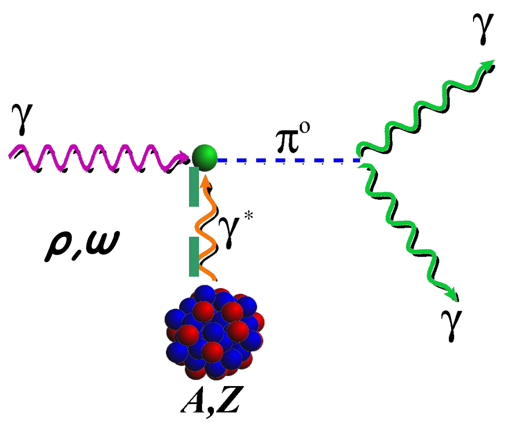
Rept. Prog. Phys. 79, no.12, 124201

Complementary to other types of experiments, pseudoscalar mesons offer unique sensitivity for sub-GeV new physics that are flavor-conserving and light quark-coupling.

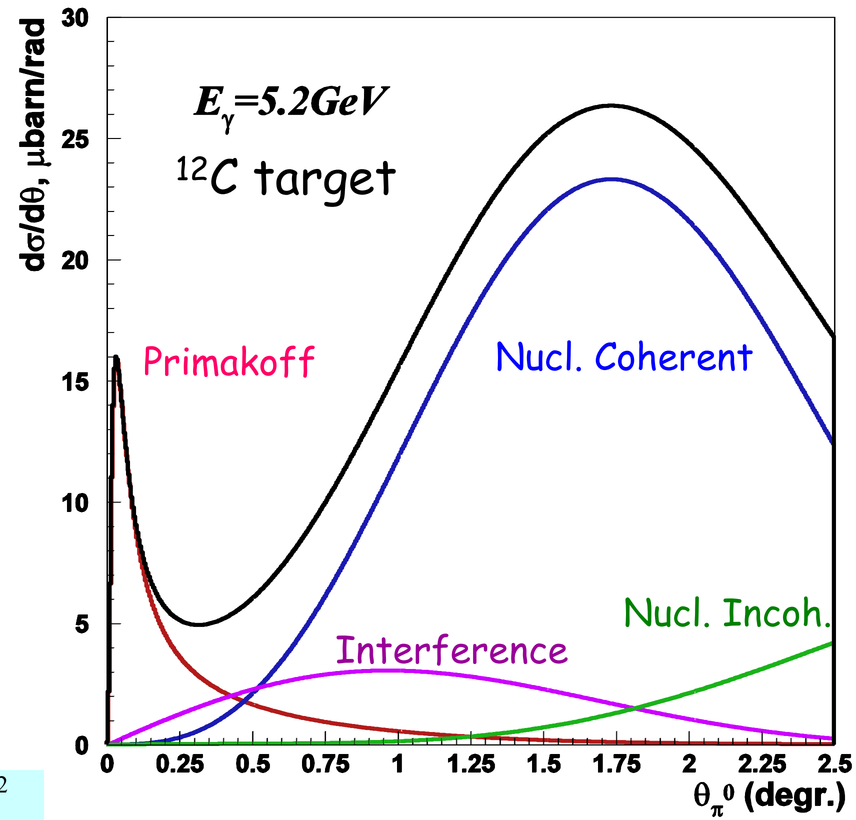
# Jefferson Lab



# Primakoff Effect



$$\frac{d\sigma_{\rm Pr}}{d\Omega} = \Gamma_{\gamma\gamma} \frac{8\alpha Z^2}{m_\pi^3} \frac{\beta^3 E^4}{Q^4} |F_{e.m.}(Q)|^2 \sin^2\theta_\pi$$



- Peaked at very small forward angle: $\langle\theta_{\rm Pr}\rangle_{peak} \propto \frac{m^2}{2E^2}$
- Beam energy sensitive:

$$\left\langle\frac{d\sigma_{Pr}}{d\Omega}\right\rangle_{peak} \propto \frac{E^4}{m^3}, \int d\sigma_{Pr} \propto \frac{Z^2}{m^3}\log E$$

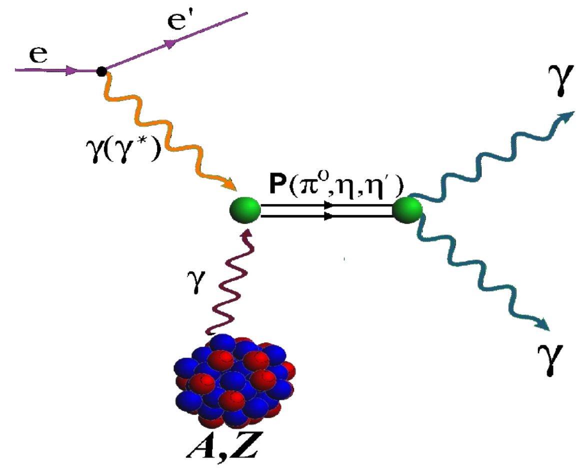
$$\langle\theta_{\rm Pr}\rangle_{peak} \propto \frac{m^2}{2E^2} \quad \langle\theta_{NC}\rangle_{peak} \propto \frac{2}{E \bullet A^{1/3}}$$

- Coherent process

- The higher beam energy is, the higher Primakoff cross section and the better separation of Primakoff from the nuclear backgrounds.
- A higher beam energy is more important for more massive particle

# PrimEx Primakoff Program at JLab 6 & 12 GeV

Precision measurements of electromagnetic properties of $\pi^0$, $\eta$, $\eta'$ via Primakoff effect



**a) Two-Photon Decay Widths:**

1) $\Gamma(\pi^0 \to \gamma\gamma)$ @ 6 GeV
2) $\Gamma(\eta \to \gamma\gamma)$
3) $\Gamma(\eta' \to \gamma\gamma)$

Input to Physics:

- precision tests of chiral symmetry and anomalies
- light quark mass ratio
- $\eta$-$\eta'$ mixing angle
- input to calculate HLbL in $(g\text{-}2)_\mu$
- origin of the visible mass

**b) Transition Form Factors at $Q^2$ of 0.001-0.3 GeV$^2$/c$^2$:**

$F(\gamma\gamma^* \to \pi^0)$, $F(\gamma\gamma^* \to \eta)$, $F(\gamma\gamma^* \to \eta')$

Input to Physics:

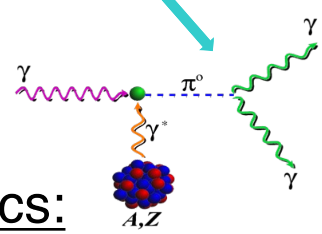
- $\pi^0$,$\eta$ and $\eta'$ electromagnetic interaction radii
- is the $\eta'$ an approximate Goldstone boson?
- input to calculate HLbL in $(g\text{-}2)_\mu$
- origin of the visible mass

# Status of Primakoff Program at JLab 6 & 12 GeV

## Precision measurements of electromagnetic properties of $\pi^0$, $\eta$, $\eta'$ via Primakoff effect

**a) Two-Photon Decay Widths:**

1) $\Gamma(\pi^0 \to \gamma\gamma)$ @ 6 GeV (in Hall B)
2) $\Gamma(\eta \to \gamma\gamma)$
3) $\Gamma(\eta' \to \gamma\gamma)$



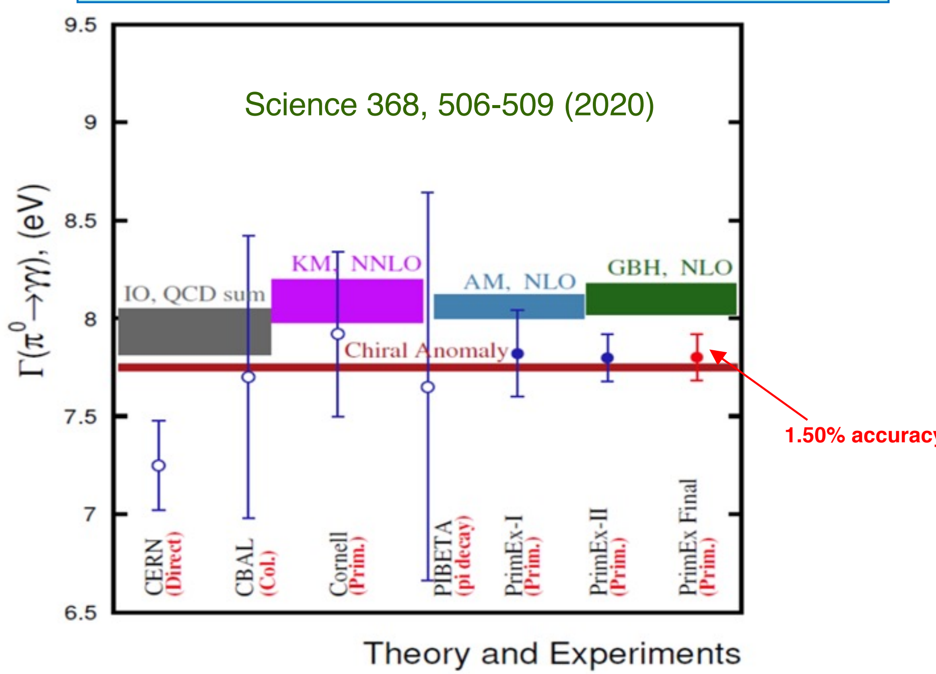
Input to Physics:

- precision tests of chiral symmetry and anomalies
- determination of light quark mass ratio
- $\eta$-$\eta'$ mixing angle
- input to calculate HLbL in $(g-2)_\mu$

- The chiral anomaly prediction is exact for massless quarks:

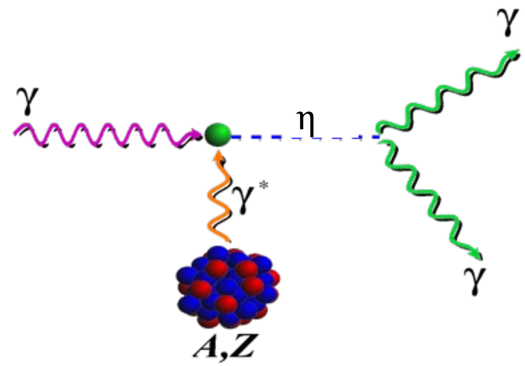
$$\Gamma(\pi^0 \to \gamma\gamma) = \frac{m_{\pi^0}^3 \alpha^2 N_c^2}{576\pi^3 F_{\pi^0}^2} = 7.750 \pm 0.016\, eV$$

- $\Gamma(\pi^0 \to \gamma\gamma)$ is one of the few quantities in confinement region that QCD can calculate precisely at ~1% level to higher orders!



# Status of Primakoff Program at JLab 6 & 12 GeV (cont.)

Precision measurements of electromagnetic properties of $\pi^0$, $\eta$, $\eta'$ via Primakoff effect



**a) Two-Photon Decay Widths:**

1) $\Gamma(\pi^0 \to \gamma\gamma)$ @ 6 GeV
2) $\Gamma(\eta \to \gamma\gamma)$
3) $\Gamma(\eta' \to \gamma\gamma)$

$$\frac{d\sigma_{Pr}}{d\Omega} = \Gamma_{\gamma\gamma} \frac{8\alpha Z^2}{m_\eta^3} \frac{\beta^3 E^4}{Q^4} |F_{e.m.}(Q^2)|^2 \sin^2\theta_\eta$$

Input to Physics:

- precision tests of chiral symmetry and anomalies
- determination of light quark mass ratio
- $\eta$-$\eta'$ mixing angle
- input to calculate HLbL in $(g-2)_\mu$

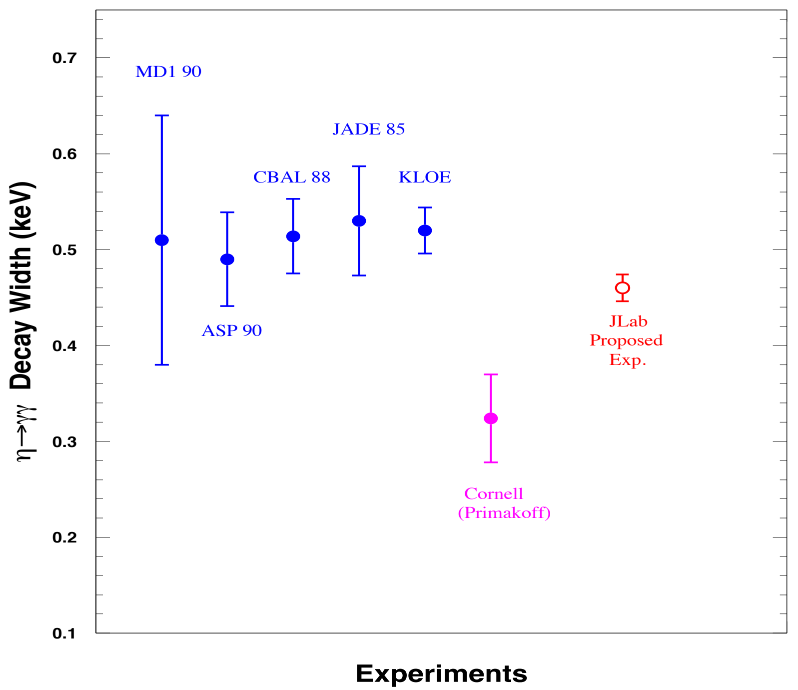
On-Going PrimEx-eta experiment (in Hall D)

- A full data set was completed via three run periods in 2019, 2021 and 2022.
- Data analysis is in progress.

(see talk by A. Somov on Tue)

# Physics for $\Gamma(\eta\rightarrow\gamma\gamma)$ Measurement

**Resolve long standing discrepancy between previous collider and Primakoff measurements:**

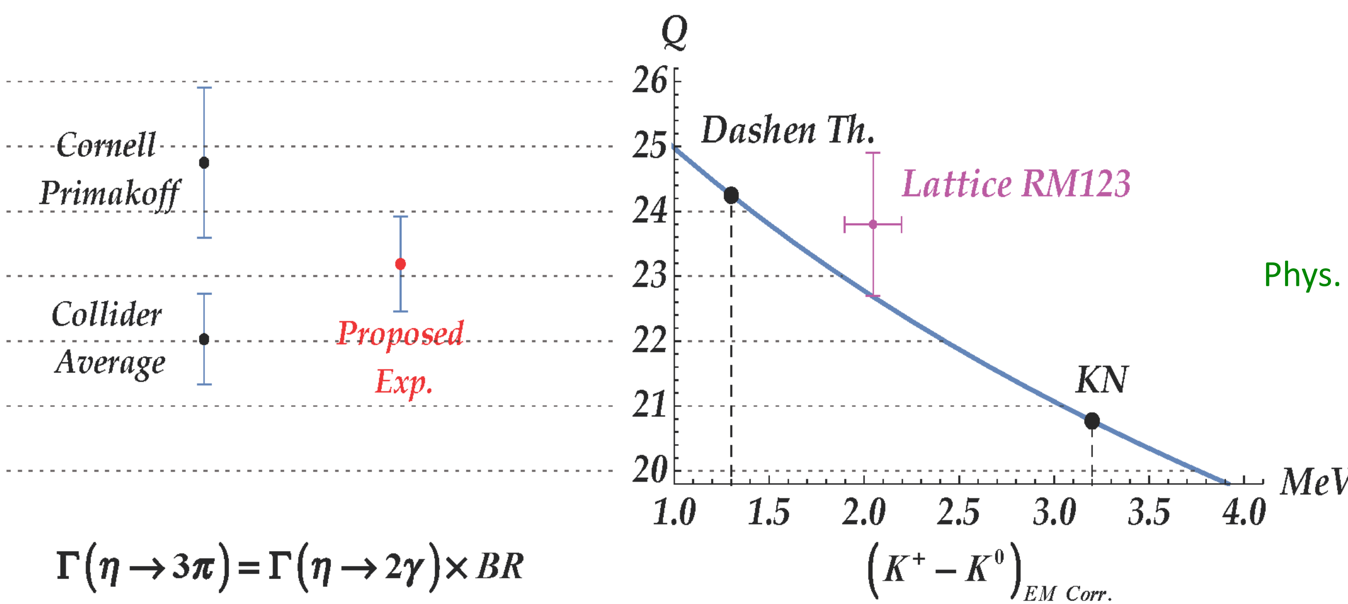


- **Extract η-η′ mixing angle**
- **Improve calculation of the η-pole contribution to Hadronic Light-by-Light (HLbL) scattering in $(g\text{-}2)_\mu$**
- **Improve all partial decay widths in the η-sector**

# Precision Determination Light Quark Mass Ratio

A clean probe for quark mass ratio: $Q^2 = \frac{m_s^2 - \hat{m}^2}{m_d^2 - m_u^2}$, where $\hat{m} = \frac{1}{2}(m_u + m_d)$

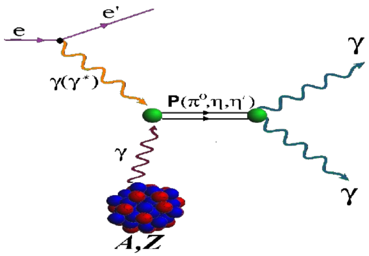
- $\eta \to 3\pi$ decays through isospin violation: $A = (m_u - m_d)A_1 + \alpha_{em} A_2$
- $\alpha_{em}$ is small
- Amplitude: $A(\eta \to 3\pi) = \frac{1}{Q^2} \frac{m_K^2}{m_\pi^2}(m_\pi^2 - m_K^2) \frac{M(s,t,u)}{3\sqrt{3}F_\pi^2}$



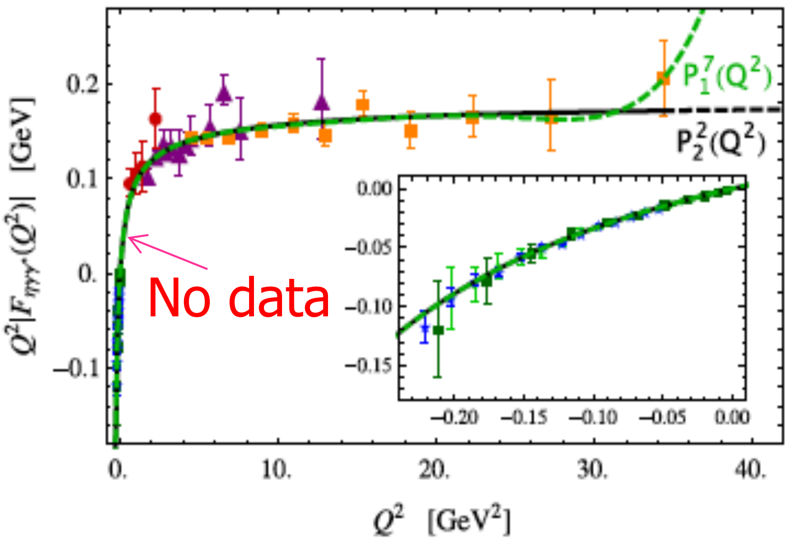
$$\Gamma(\eta \to 3\pi) = \Gamma(\eta \to 2\gamma) \times BR$$

Phys. Rept. 945 (2022) 1-105

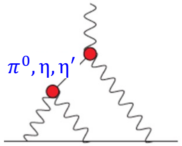
# Space-Like Transition Form Factors
## ($Q^2$ : 0.001-0.3 $GeV^2/c^2$)

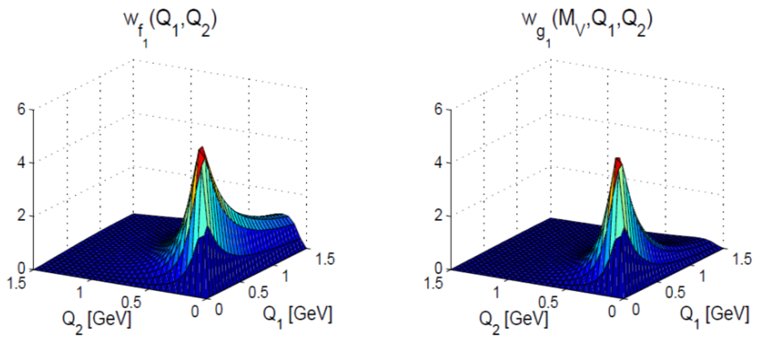


- Direct measurement of slopes
  - Interaction radii: $F_{\gamma\gamma^* P}(Q^2) \approx 1 - 1/6 \cdot \langle r^2 \rangle_P Q^2$
  - ChPT for large $N_c$ predicts relation between the three slopes. Extraction of $O(p^6)$ low-energy constant in the chiral Lagrangian

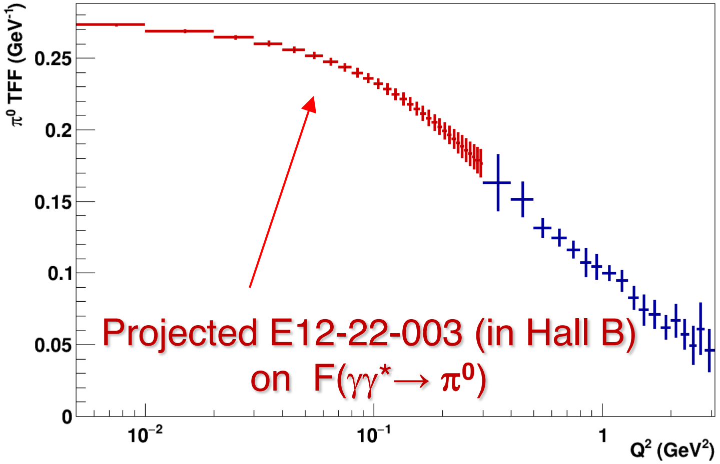


- Input for hadronic light-by-light calculations in muon (g-2)





Phys.Rev.D65,073034



# New opportunities with JLab 22 GeV Upgrade

1. The first $\pi^0$ Primakoff production off an electron target to measure $\Gamma(\pi^0 \rightarrow \gamma\gamma)$ and $F(\gamma\gamma^* \rightarrow \pi^0)$.

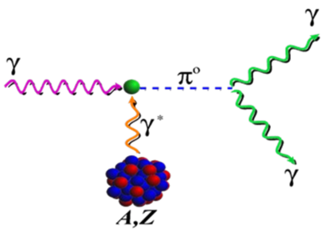
2. Improve the precisions of $\eta/\eta'$ Promakoff production off nuclear targets.

3. Search for new sub-GeV gauge bosons (scalars and pseudoscalars) via the Primakoff production:
   - Strong CP and Hierarchy problems
   - $(g-2)_\mu$ and puzzle of proton charge radius
   - Portals coupling SM to the dark sector:

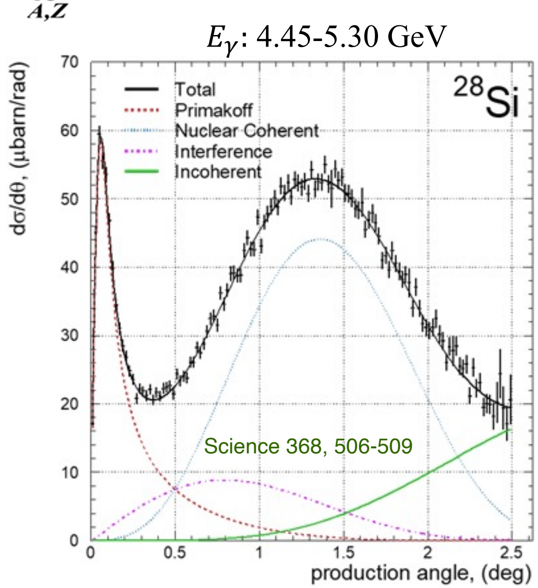
$$H^+H(\varepsilon S + \lambda S^2) \qquad c_{\gamma\gamma}\frac{\alpha}{4\pi}\frac{a}{f}F_{\mu\nu}\widetilde{F}^{\mu\nu} + c_{GG}\frac{\alpha_s}{4\pi}\frac{a}{f}G^a_{\mu\nu}\widetilde{G}^{a,\mu\nu}$$

# Advantages of the $\pi^0$ Primakoff Production off an Electron

PrimEx-II: $\gamma + {}^{28}Si \rightarrow \pi^0 + {}^{28}Si$

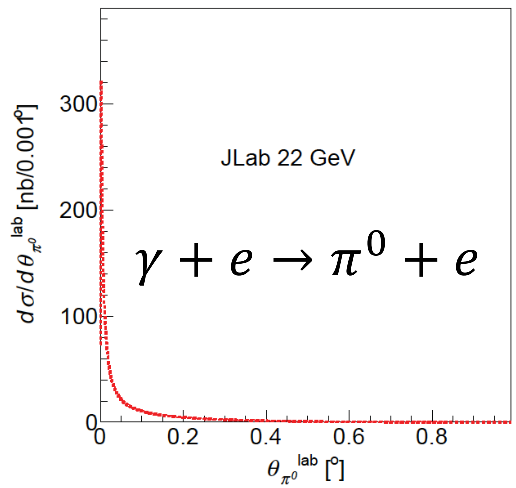


$$\frac{d\sigma_{Pr}}{d\Omega} = \Gamma_{\gamma\gamma} \frac{8\alpha Z^2}{m_\pi^3} \frac{\beta^3 E^4}{Q^4} |F_{e.m.}(Q)|^2 \sin^2\theta_\pi$$



## Advantages of an electron target:

- Eliminate all nuclear backgrounds
- A point-like electron target to eliminate nuclear effects
- Recoiled electron detection



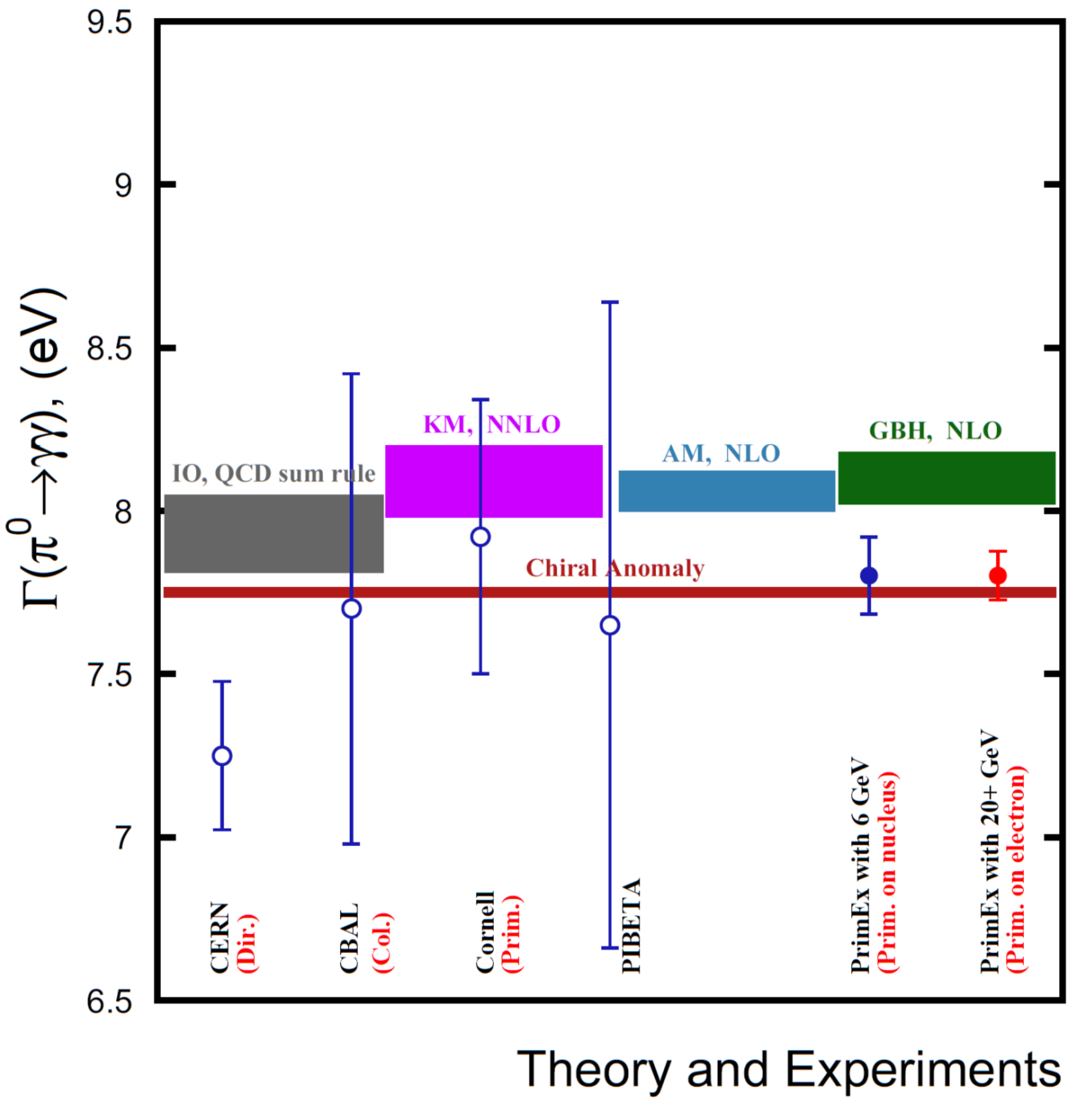
$$\frac{d\sigma_{Pr}}{d\Omega} = \Gamma_{\gamma\gamma} \frac{8\alpha}{m_\pi^3} \frac{\beta^3 E^4}{Q^4} \sin^2\theta_\pi$$

## Main challenges for the nuclear target:

- Nuclear backgrounds
- Nuclear effects
- No recoil detection

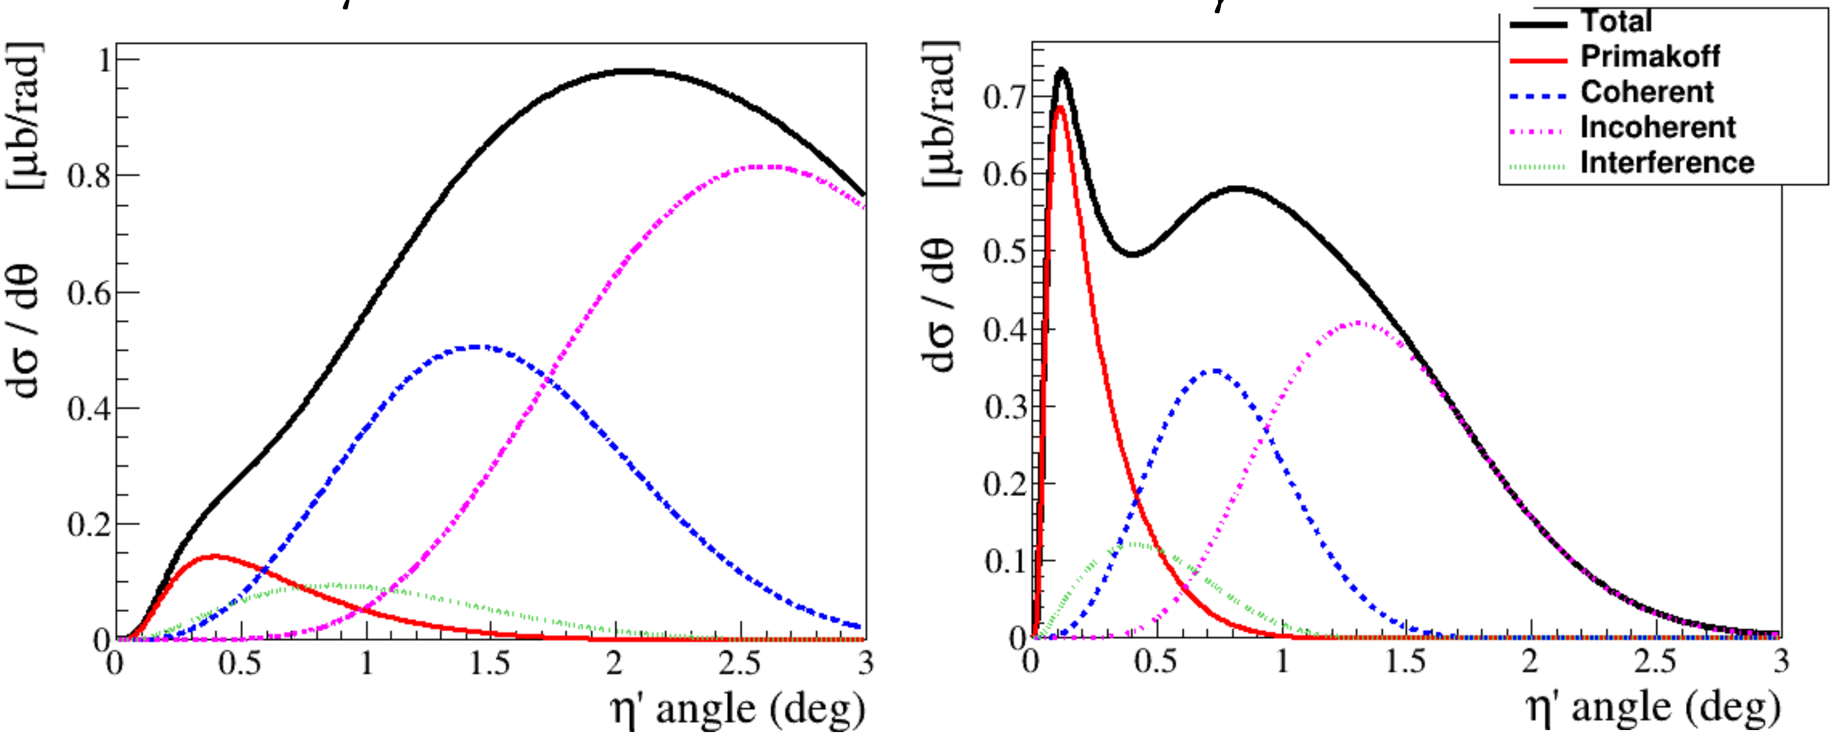
| Measurement | Reaction | $E_{th}$ (GeV) |
|---|---|---|
| $\Gamma(\pi^0 \rightarrow \gamma\gamma)$ | $\gamma + e \rightarrow \pi^0 + e$ | 18.0 |
| $F(\gamma^*\gamma \rightarrow \pi^0)$ | $e + e \rightarrow \pi^0 + e + e$ | 18.1 |

# Projected $\Gamma(\pi^0 \rightarrow \gamma\gamma)$ at JLab 22 GeV with an Electron Target



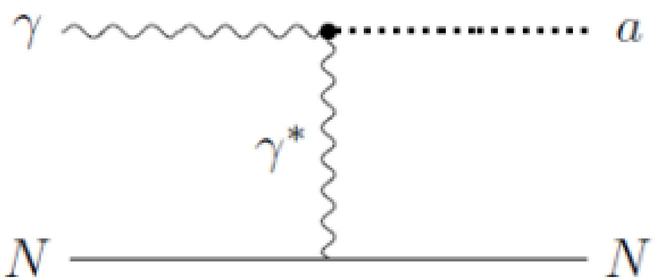
# Improve Primakoff Measurements of $\eta/\eta'$ with nuclear targets

$E_\gamma = 10$ GeV $\qquad E_\gamma = 20$ GeV



$$\gamma + {}^4He \rightarrow \eta' + {}^4He$$

# Search for sub-GeV Scalar and Pseudoscalar via Primakoff Effect



$$\mathcal{L}_{\rm eff} \supset \frac{c_\gamma}{4\Lambda} a F^{\mu\nu} \tilde{F}_{\mu\nu}$$

$$\frac{d\sigma_{Pr}}{d\Omega} \sim \frac{c_\gamma^2 \alpha Z^2}{8\pi\Lambda^2} \cdot \frac{\beta^3 E^4}{Q^4} \cdot |F_{e.m.}(Q)|^2 sin^2\theta_a$$

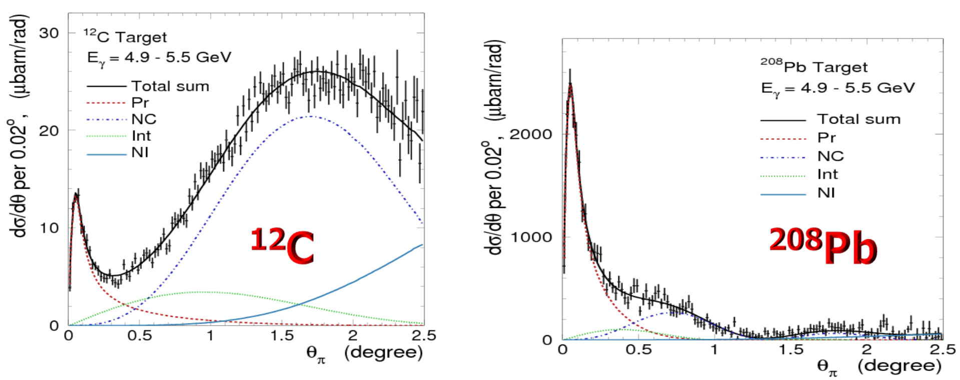
The Primakoff signal dominates in the forward angles

↓

Minimizing the QCD backgrounds

**Favorable experimental condition:**

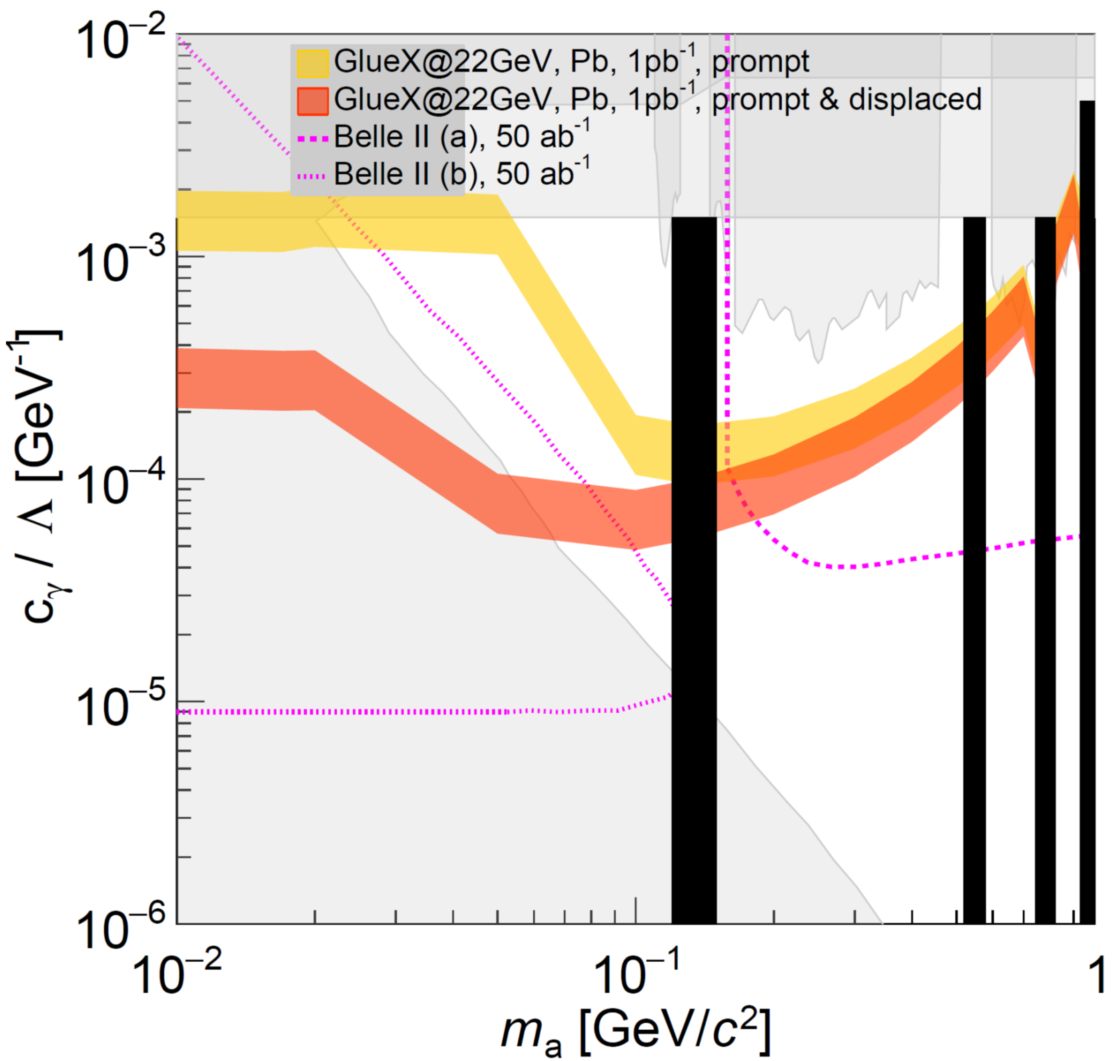
- A high energy beam
- A high Z nuclear target



PrimEx I

Phys.Rev.Lett. 106 (2011) 162303

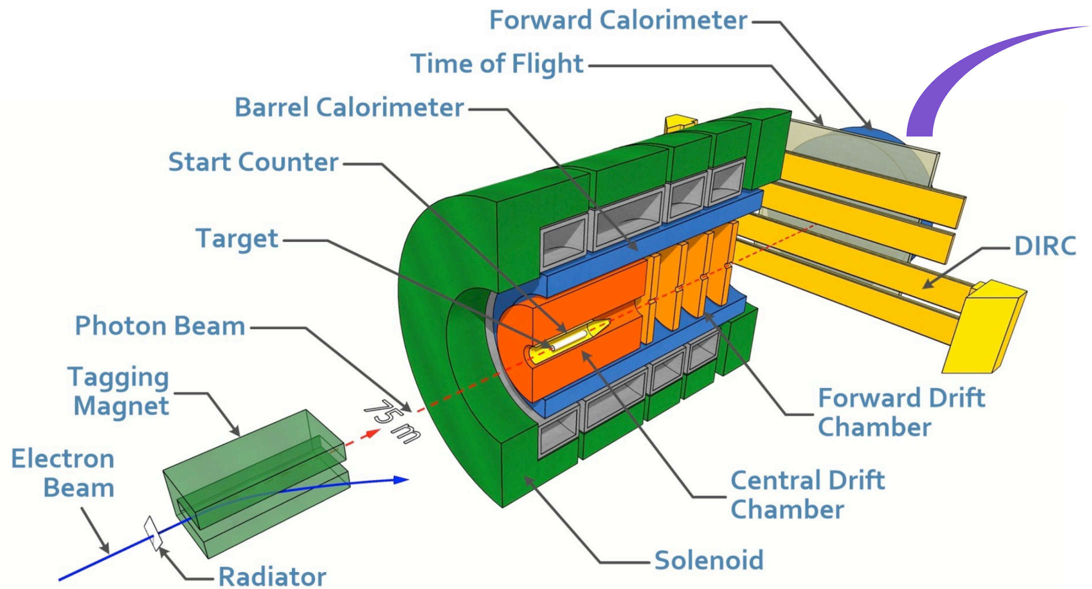
# Projected Reach for a ALP at JLab 22 GeV

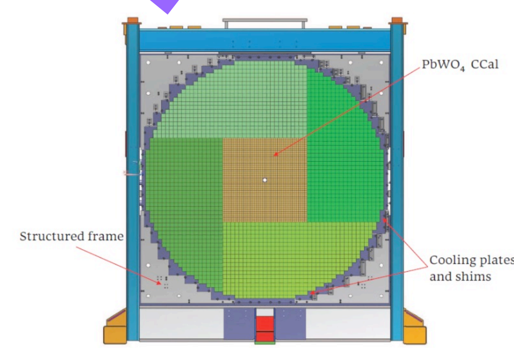


$$\gamma + Pb \rightarrow a + Pb$$

$$a \rightarrow \gamma\gamma$$

# JLab Eta Factory (JEF) Experiment at GlueX





FCAL-II

- Simultaneously produce $\eta/\eta'$ on $LH_2$ target with 8.4-11.7 GeV tagged photon beam via $\gamma+p \rightarrow \eta/\eta'+p$
- Reduce non-coplanar backgrounds by detecting recoil protons with GlueX detector
- Upgraded Forward Calorimeter with High resolution, high granularity $PbWO_4$ insertion (FCAL-II) to detect multi-photons from the $\eta/\eta'$ decays
- The GlueX detector will detect the charged products from the $\eta/\eta'$ decays

# Uniqueness of JEF Experiment

1. Suppressed backgrounds in rare neutral decays comparing to the other experiments using:
   a) $\eta/\eta'$ energy boost; b) upgraded FCAL-II; c) recoil detection

2. Capability of running in parallel with GlueX and other experiments in Hall D
   → potential for a high-statistics data set

3. Simultaneously produce tagged $\eta$ and $\eta'$ with similar rates ($\sim 5\times10^5$ per day)

# Main JEF Physics Objectives

1. **Search for sub-GeV hidden bosons**

   *vector:*

   - Leptophobic vector *B '*

     $$\eta, \eta' \to B'\gamma \to \pi^0\gamma\gamma, \ (0.14 < m_{B'} < 0.62 \text{ GeV});$$
     $$\eta' \to B'\gamma \to \pi^+\pi^-\pi^0\gamma, \ (0.62 < m_{B'} < 1 \text{ GeV}).$$

   - Hidden or dark photon: $\eta, \eta' \to X\gamma \to e^+e^-\gamma$ .

   *scalar S:* $\eta \to \pi^0 S \to \pi^0\gamma\gamma, \ \pi^0 e^+e^-, \ (10 \text{ MeV} < m_S < 2m_\pi);$
   $\eta, \eta' \to \pi^0 S \to 3\pi, \ \eta' \to \eta S \to \eta\pi\pi, \ (m_S > 2m_\pi).$

   *Axion-Like Particles (ALP):* $\eta, \eta' \to \pi\pi a \to \pi\pi\gamma\gamma, \ \pi\pi e^+e^-$

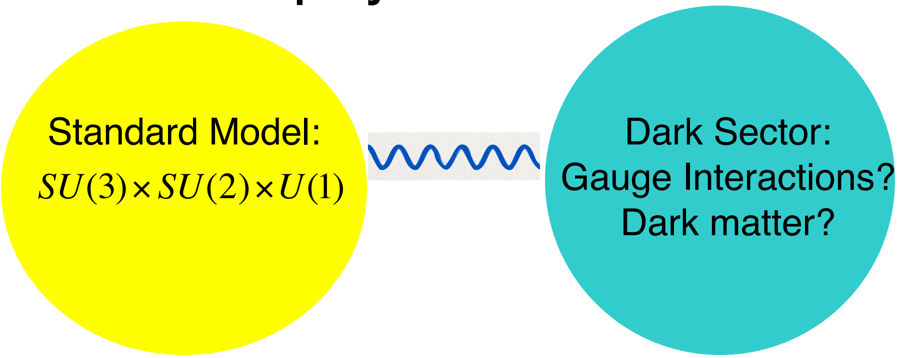
2. **Directly constrain CVPC new physics:** $\eta^{(\prime)} \to 3\gamma$, $\eta^{(\prime)} \to 2\pi^0\gamma$, $\eta^{(\prime)} \to \pi^+\pi^-\pi^0$

3. **Precision tests of low-energy QCD:**
   - Interplay of VMD & scalar dynamics in ChPT: $\eta \to \pi^0\gamma\gamma$ $\eta' \to \pi^0\gamma\gamma$
   - Transition Form Factors of $\eta^{(\prime)}$: $\eta^{(\prime)} \to e^+e^-\gamma$

4. **Improve the light quark mass ratio via Dalitz distributions of $\eta \to 3\pi$**

# Example of a Key Channel: $\eta\to\pi^0\gamma\gamma$

1. New physics:



**Portal:** $(n=4)$

vector $\kappa B^{\mu\nu}V_{\mu\nu}$

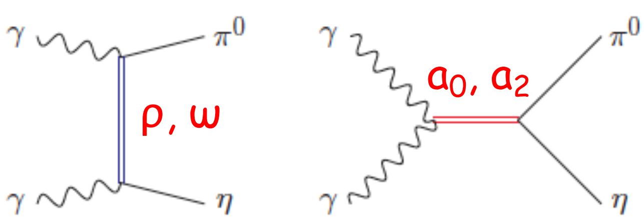
Scalar $H^{+}H(\varepsilon S+\lambda S^{2})$

fermion $\xi LHN$

- **Search for sub-GeV gauge bosons**
  - A leptophobic vector B′:
    $\eta\to\gamma B'$, $B'\to\pi^0\gamma$ PR,D89,114008
  - An electrophobic scalar Φ′:
    $\eta\to\pi^0\Phi'$, $\Phi'\to\gamma\gamma$

PRL 117,101801 (2016); PL B740,61(2015)

2. Confinement QCD:



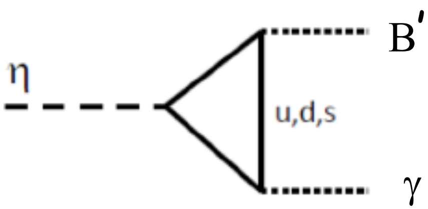
Gasser, Leutwyler 84; Ecler, Gasser, Pich, de Rafael1989; Donoghue, Ramirez, Valencia 1989

- **A rare window to probe interplay of VMD & scalar resonance in ChPT**

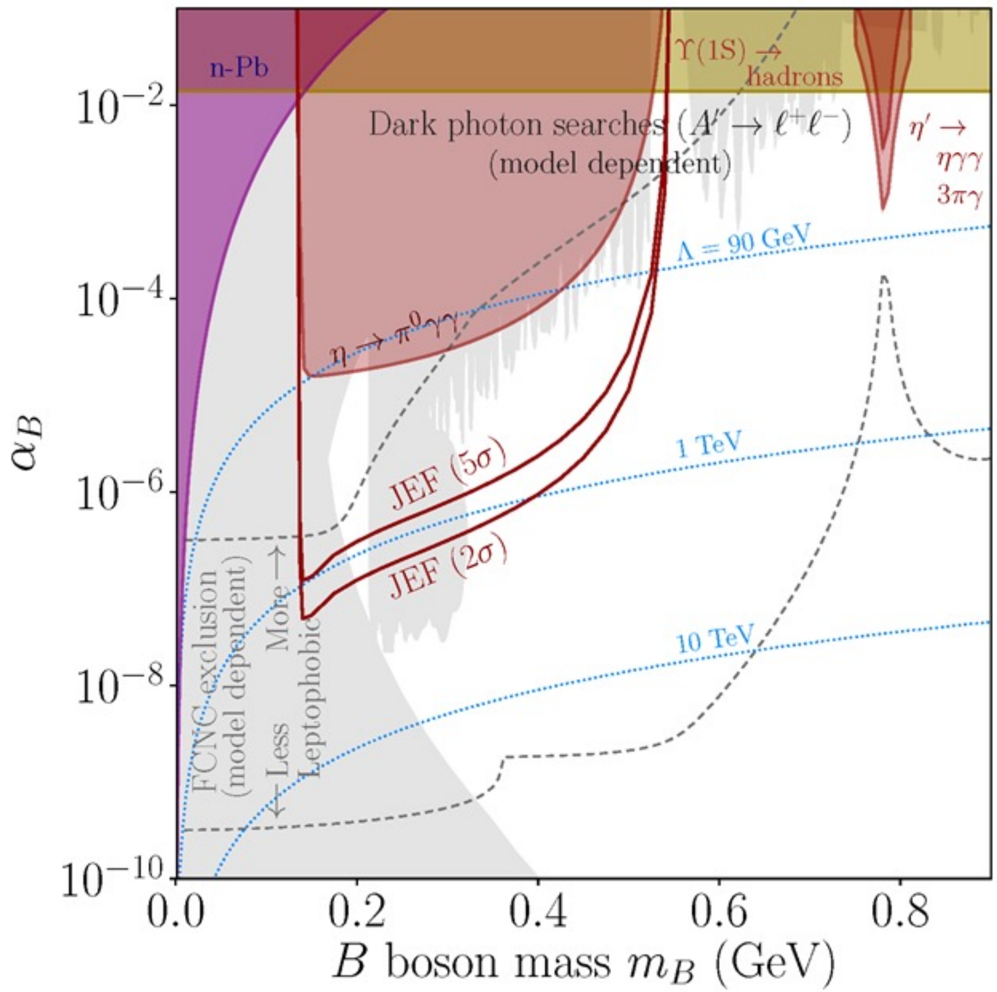
# JEF Experimental Reach for B′

A search for a leptophobic dark B' boson coupled to baryon number is complementary to ongoing searches for a dark photon

$\eta \to B'\gamma \to \pi^0\gamma\gamma$

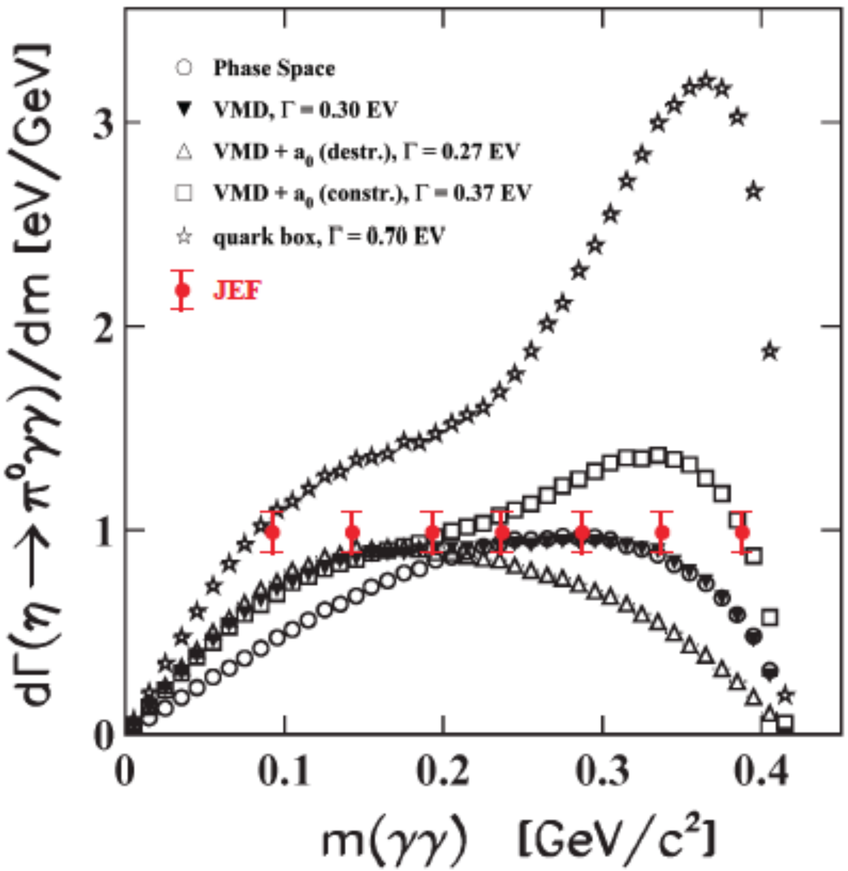


PL, B221, 80 (1989)
PR,D89,114008

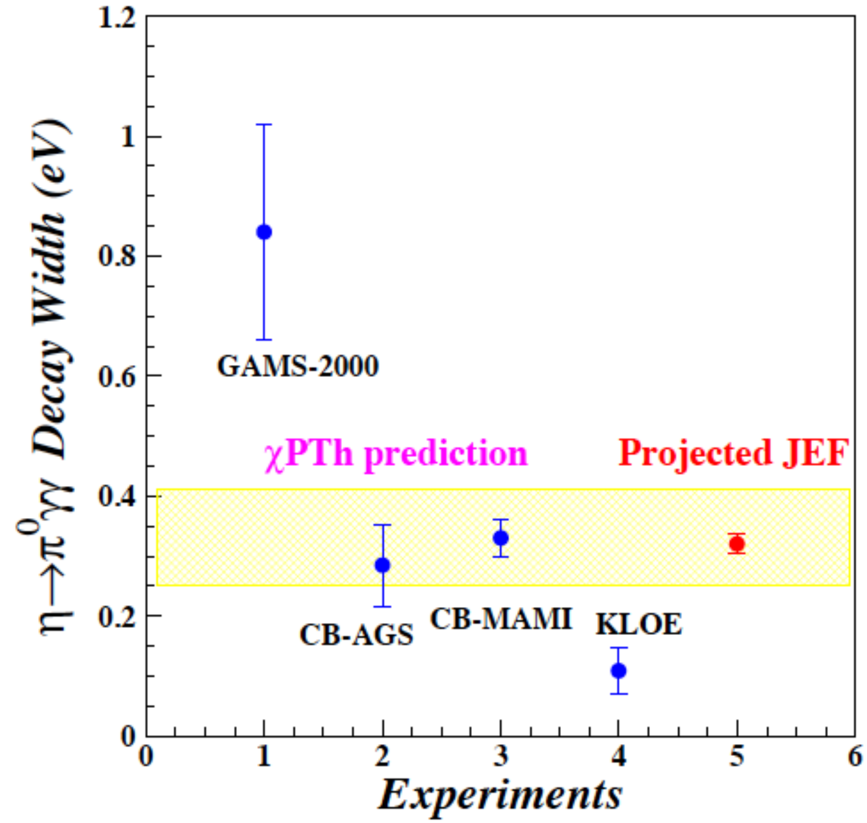


# Projected JEF on SM Allowed $\eta\to\pi^0\gamma\gamma$

J.N. Ng and D.J. Peters, Phys. Rev. D47, 4939



χPTh by Oset et al., Phys. Rev. D77, 073001



We measure both BR and Dalitz distribution

- model-independent determination of two LEC's of the $O(p^6)$ counter- terms
- probe the role of scalar resonances to calculate other unknown $O(p^6)$ LEC's

J. Bijnens, talk at AFCI workshop

# Test Charge Conjugation Invariance

- C is maximally violated in the weak force and is well tested.
- Assumed in SM for electromagnetic and strong forces, but it is not experimentally well tested

(current direct constraint: $\Lambda \geq 1$ GeV)

C Violating η neutral decays

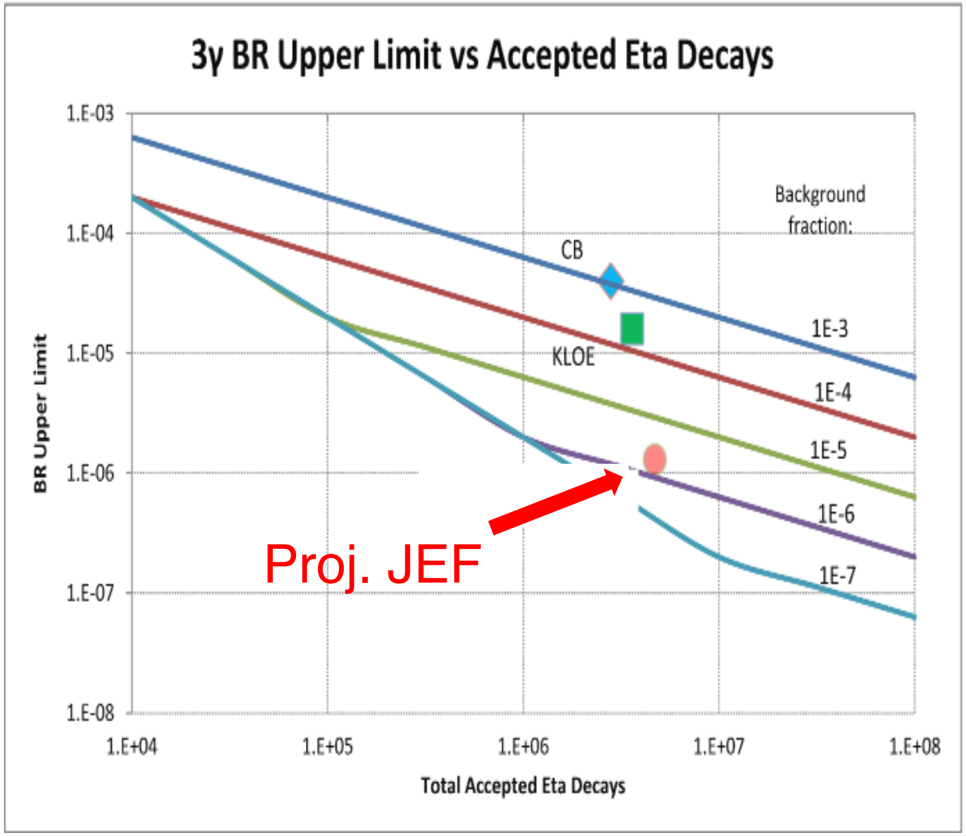
| Mode | Branching Ratio (upper limit) | No. γ's |
|---|---|---|
| $3\gamma$ | $< 1.6 \cdot 10^{-5}$ | 3 |
| $\pi^0\gamma$ | $< 9 \cdot 10^{-5}$ | |
| $2\pi^0\gamma$ | $< 5 \cdot 10^{-4}$ | 5 |
| $3\gamma\pi^0$ | Nothing published | |
| $3\pi^0\gamma$ | $< 6 \cdot 10^{-5}$ | 7 |
| $3\gamma 2\pi^0$ | Nothing published | |

# Experimental Improvement on C-violating $\eta \to 3\gamma$

- SM contribution: BR($\eta \to 3\gamma$) $<10^{-19}$ via P-violating weak interaction.

- A calculation due to new physics by Tarasov suggests: BR($\eta \to 3\gamma$)$< 10^{-2}$

Sov.J.Nucl.Phys.,5,445 (1967)

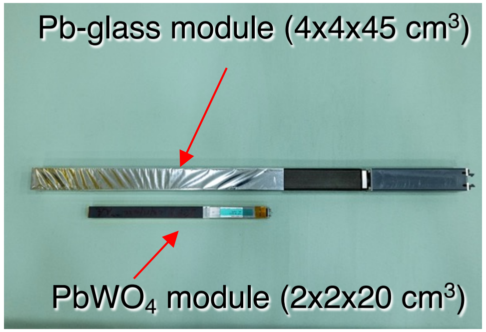


Improve BR upper limit by one order of magnitude to directly tighten the constraint on CVPC new physics

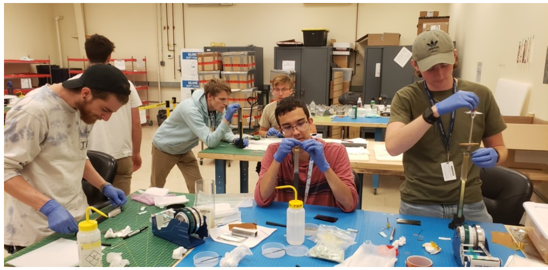
# Status of the JEF Experiment

1. Developed an upgraded FCAL-II with a $PbWO_4$ insert.

- 1596 $PbWO_4$ modules are developed to replace ~400 Pb-glass modules.
- Installation of the upgraded FCAL-II has been on-going since Mar 2023 and will be completed by the end of 2024.
- Over 40 undergraduate students from 11 institutes were trained by involving in this project.

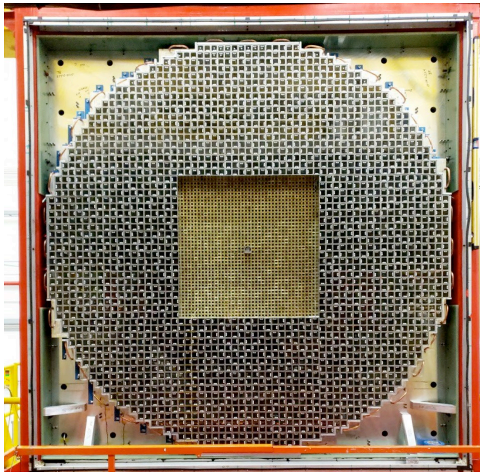


Undergraduate workforce



May 2023

Oct 6, 2023



2. Commissioning of FCAL-II and data taking with FCAL-II are scheduled to start in Jan 2025.

# Summary

- Light pseudoscalar mesons offer a sensitive probe to test fundamental symmetries and to search for new physics beyond the standard model.

- PrimEx Primakoff program

  has been in progress @ 6&12 GeV
  - ✓ The published PrimEx result on the $\pi^0$ lifetime provides a stringent test of low-energy QCD.
  - ✓ Data collection on $\Gamma(\eta \to \gamma\gamma)$ was completed in 2022 and data analysis is in progress.
  - ✓ A new experiment on $F(\pi^0 \to \gamma^* \gamma)$ off a nuclear target is on the way.

  future JLab 22 GeV upgrade will offer new opportunities
  - ✓ New generation of Primakoff experiments on $\Gamma(\pi^0 \to \gamma\gamma)$ and $F(\gamma^*\gamma \to \pi^0)$ off an atomic electron target.
  - ✓ Improve measurements of more massive particles, such as η and η', off nuclear targets.
  - ✓ Search for new sub-GeV gauge bosons (scalars and pseudoscalars).

- The JEF experiment will start data collection in Jan 2025 using newly upgraded FCAL-II calorimeter with a PbWO4 insert.
  - ✓ Search for sub-GeV hidden bosons: vector, scalar, and ALP
  - ✓ Directly constrain CVPC new physics
  - ✓ Precision tests of low-energy QCD: the role of scalar dynamics in ChPT; transition form factors of η/η' to calculate HLbL contributions in $(g\text{-}2)_\mu$
